

# Regional Gross Value Added

---

**This article presents estimates for regional gross value added (GVA) at current basic prices for NUTS1<sup>1</sup> 1989 to 2004, and NUTS2&3<sup>1</sup> 1995 to 2003 estimates published on 21 December 2005.**

The headline estimates are a moving average based trend of the unadjusted estimates for each region. These adjusted series remove some year-to-year volatility in the unadjusted series.

## **IN BRIEF**

### **TOTAL**

- In comparison with the previous year UK total GVA grew at current prices by 5.3 per cent in 2004 but excluding Extra-regio it grew by 4.6 per cent.
- Total GVA increased in all UK regions although there was variation in the rate of increase.
- GVA per head of population was £16,800 for the UK as a whole (excluding Extra-regio).

### **NUTS 1**

- London had the largest share of GVA in 2004 with 16.4 per cent of total UK GVA (excluding Extra-regio) while Northern Ireland had the smallest share with 2.3 per cent.
- London had the smallest growth rate, 3.5 per cent, between 2003 and 2004.
- London had the highest GVA per head of population (£22,200) while Wales had the lowest (£13,300).
- London, the South East and East of England were the only regions with a GVA per head above the average for the UK population.

### **NUTS 2**

- Inner London had the largest GVA in 2003 (£113 billion) while the Highlands and Islands had the smallest (£4 billion)
- Growth in total GVA between 2002 and 2003 was highest in Lincolnshire (7.4 per cent); Essex (7.0 per cent) and North Yorkshire (6.9 per cent).
- Inner London had, in 2003, the highest GVA per head of population (£38,800); more than double the UK average (£16,100). Berkshire, Buckinghamshire & Oxfordshire (£22,700); and North East Scotland (£21,200) followed.

### **NUTS 3**

- Inner London West had the highest percentage (7.6 per cent) of UK GVA, followed by Inner London East (4.1 per cent) in 2003. Outside London, Greater Manchester South had the highest percentage (2.6 per cent).
- Torbay (3.0 per cent), West Lothian (3.1 per cent), and Gwent Valleys (3.8 per cent) had the lowest growth between 2002 and 2003.
- The Isle of Anglesey had the lowest GVA per head of population (£8,700), followed by Gwent Valleys (£9,500) and Wirral (£9,700) in 2003.

The geographic patterns of GVA per head of population across NUTS1, NUTS2 and NUTS3 areas of the UK are illustrated in the following maps.

### Regional GVA tables

**Annex A – NUTS 1 Revisions Analysis**

**Annex B – Background Notes**

**Annex C – HMRC PAYE Matching Exercise**

## I INTRODUCTION

The regional GVA estimates published in this article are calculated according to the income approach<sup>2</sup>. They include first estimates for 2004 (NUTS1) and 2003 (NUTS2&3) and revisions for 1989 to 2003 (NUTS1) and 1995 to 2002 (NUTS2&3).

## II MAIN DATA SOURCES

### Blue Book national controls

The regional GVA estimates NUTS1 1989 to 2004 and NUTS2&3 1995 to 2003 estimates are consistent with estimates of UK GVA published in National Accounts *Blue Book 2005*.

### Wages and salaries – HMRC PAYE

Her Majesty's Revenue and Customs' (HMRC) pay-as-you earn (PAYE) dataset has been incorporated into the estimates for the second year running after a successful conclusion to work carried out assessing the suitability of PAYE regional information for use in the estimation of NUTS1 GVA.

### Earnings

The Annual Survey of Hours and Earnings (ASHE) replaced the New Earnings Survey (NES) from October 2004. The main differences between ASHE and NES methodologies for 1998 and 2003 are the estimation of missing responses and weighting of the results to the population of jobs measured by the Labour Force Survey (LFS). In addition to earlier years the ASHE from 2004 onwards will extend its coverage to include VAT only businesses.

### Employment

These estimates use employment data from the Annual Business Inquiry 1 (ABI1) and the Short Term Earnings Survey (STES). STES data used here are unbenchmarked to the ABI1 as they were not available in time to be considered for publication. ONS carried out analysis to assess the validity of using the unbenchmarked series.

The proportions of benchmarked and unbenchmarked data were compared for actual changes as part of the apportionment methodology. The analysis showed that for all changes in levels the proportions remained similar.

### Financial Intermediation Services Indirectly Measured (FISIM)

FISIM estimates in this publication have been calculated as per the published regional GVA methodologies i.e. using wages and salaries within the financial intermediation sector.

However, the United Kingdom (UK) along with all other EU national statistics institutes (NSI) is bound by regulation 1889/2002. This means that by the end of 2005 all GVA estimates supplied to Eurostat should have FISIM allocated to the industries that consume the service, both at a national and regional level.

The impact at a regional level is nil as FISIM has been calculated first, as per previous publications, then allocated to the regional industries per the national industry distribution.

---

<sup>2</sup> See background note 4

## Finance

In addition to the labour market sources, business surveys and administrative data are also used in the compilation of regional GVA estimates. The most significant business survey source is the Annual Business Inquiry 2 (ABI2) which captures financial information (for example, turnover) relating to the UK activity of companies - approximately two thirds of the UK economy is covered by the survey.

## Commuting patterns

Information on commuting patterns is used to derive the workplace-based estimates of regional GVA. Longstanding plans have been in place to investigate the commuting patterns between regions. The investigations will show if and how commuting patterns have changed and determine which regions experience a significant degree of net commuting.

An initial assessment suggests the current assumption that the only significant net commuting between NUTS1 regions is between London, the South East and East of England still stands, however, further work needs to be carried out. See Section VII Future Work Plans.

## III LATEST YEAR ESTIMATES

Estimates released for the first time are for 2004 at NUTS1 and for 2003 at NUTS2&3.

### New data

- New HMRC data for 2003/04
- ASHE data 2004
- ABI2 2003
- STES 2004

### NUTS1 Latest Year Estimates

#### HMRC PAYE

New data has been provided by Her Majesty's Customs and Revenue (HMRC) for 2003/04. This data (PAYE) has been used in the latest GVA estimates.

## Earnings – ASHE

In 2004, when NES was replaced by ASHE (see Section V Quality Adjustments for more details), part of the change was the introduction of new supplementary surveys to improve the coverage of ASHE. In 2004 two sets of results were produced; one including and one excluding new supplementary surveys giving best estimates of levels in 2004; the latter providing a comparable basis with ASHE data for 2003 and earlier. To anticipate future developments the ASHE data set including supplementary surveys was employed to produce earnings estimates for GVA NUTS1.

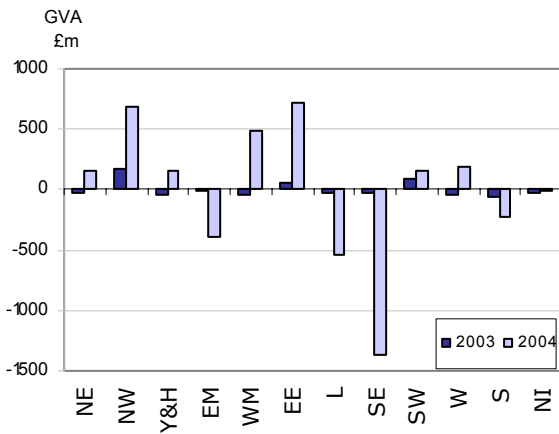

The growth of weekly average earnings in the UK according to ASHE was 3.6 per cent. For male full-timers average weekly earnings (mean) grew by 3.2 per cent, while female full-time earnings saw stronger growth at 4.9 per cent. The North East experienced the fastest growth for both male and female full-timers' earnings (5.6 per cent and 9.1 per cent respectively), even though they have the lowest average earnings in the UK.

Figure 1 Year on Year Annual Change in Average Weekly Earnings for Male Full-timers.

ASHE had a big impact on the South East in absolute terms. A regional GVA decrease of £1.4 billion was mainly due to weekly average earnings declining in industry E (electricity, gas and water supply) and zero growth in industry K (real estate, renting and business activities). Due to the constraint of all input data to UK totals (as in *Blue Book 2005*), per industry, the South East's weaker growth in major industries, in comparison to other regions, resulted in a regional GVA decrease. The East of England and the North West showed the biggest increase in regional GVA due to ASHE in 2004.

Figure 2 ASHE Impact Analysis

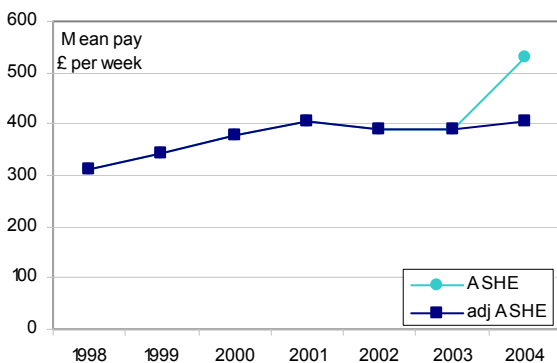

**ASHE Quality Adjustments to Latest Year Estimates**

A number of quality adjustments have been made at NUTS1 to outliers. The 2004 ASHE results are provisional and subject to revisions following 2005 regional data delivery. Outliers in the 2004 dataset were brought in line with the general growth trend.

For example, figure 3 shows an adjustment to male full-time weekly pay in 2004 in industry O (other community, social and personal service activities) for Northern Ireland. The results for 2004 were adjusted from a rise of 37.1 per cent to 4.6 per cent in line with the UK growth in industry O.

Figure 3 Quality Adjustments to Male Full-time Earnings in Northern Ireland in Industry O

**ABI2 NUTS1 Latest estimates**

The inclusion of the latest estimates available from the ABI2 impacts mainly on industry DA (food, tobacco and beverages). The highest growth in this sector was seen in the East Midlands and the East of England; both

grew by six per cent (national average growth was three per cent). Scotland, one of the five largest food manufacturing regions, showed a below average, one per cent, growth.

**Employment – STES**

Figure 4 Impact of STES 2004 Data on NUTS 1 GVA

The above graph shows the impact of STES on NUTS1 GVA in 2004 caused primarily by declining employment in industry E (electricity, gas and water supply) in the North West. Male full-time employment fell from 9,000 in 2002 to 5,900 in 2003 and then again in 2004 to 5,700. Female full-time employment also fell over the same time-period; from 4,800 in 2002 to 2,400 in 2003 and then again in 2004 to 1,300. The impact of these changes contributed to a £0.8 billion GVA decrease in the North West in 2004.

The increase of £0.7 billion to Yorkshire and The Humber’s GVA was influenced by rising employment in industry I (transport, storage and communication). Male full-time employment rose from 81,000 to 95,000 between 2003 and 2004.

Conversely, a drop in male full-time employment from 70,000 to 67,000 between 2003 and 2004 influenced the £0.6 billion decrease to East Midland’s GVA in 2004.

**NUTS2 and NUTS3**

The latest estimates show that of the NUTS2 areas, Lincolnshire had the highest growth rate of 7.4 per cent between 2002 and 2003. Outer London had the lowest growth rate – 4.5 per cent - over the same period. The areas with the next highest growth rates between 2002 and 2003 were: Essex (7.0 per cent) and North Yorkshire (6.9 per cent).

Within the 12 regions of the UK (NUTS1), the GVA of the 37 sub-regions (NUTS2) and 133 unitary authorities and districts (NUTS3) can vary considerably. For example, GVA per head of population in the NUTS1 region of London was £22,200 in 2003; within the NUTS2 areas of Inner London and Outer London per head figures were £38,800 and £15,000 respectively; while at NUTS3, GVA per head's in Inner London-West were £68,300 and in Outer London-East & North East, £10,900.

### ASHE

At NUTS2&3, by substituting lower level geography data with the next higher level, data quality concerns due to low observation count and high volatility were adjusted according to the 'top-down' approach. Low observation count in industries A02 (forestry), B (fishing), C (mining and quarrying) resulted in the substitution of most NUTS2&3 data with relevant NUTS1 values.

As mentioned above, the new ASHE results have had a big impact on the South East. In the NUTS2 area Surrey, East and West Sussex, the impact of ASHE on total GVA was a £900 million decrease driven by a decline in average weekly earnings in industry J (financial intermediation) and industry K (real estate, renting and business activities). The negative impact was offset by increases in Berkshire, Buckinghamshire & Oxfordshire and Hampshire & Isle of Wight. The effect of the ASHE results are offset by other survey results employed in the estimation process.

The results of ASHE show that growth rates in full-time average earnings vary significantly between regions. For example, in 2003 there was a growth in service industry earnings in three local areas of Devon (Plymouth, Torbay and Devon County Council). This was attributed to a decline of 3 per cent and increases of 10 and 4 per cent in each respective area. This compares to a UK growth in full-time average service industry earnings of 3 per cent.

Figure 5 Comparison of Growth Rates in Devon in 2003

### ABI1

ABI1 employment data are used in the estimation of GVA at NUTS2&3 only.

Employment data had a notable impact on the NUTS2 area of Lincolnshire's economy. The GVA for Lincolnshire increased by 7.4 per cent between 2002 and 2003 (at basic prices), compared to the national growth of 5.6 per cent. Of the growth in GVA for Lincolnshire around 50 per cent was caused by changing employment. For example real estate, renting and business activities (industry K) increased by 20 per cent from 2002 (15,000) to 2003 (18,000).

## IV DIVERSITY OF THE NUTS1 REGIONS

Scotland, Wales, Northern Ireland and the regions of England are all different in character, industrial structure and economic performance. The table overleaf (figure 6) shows some of the differences. Scotland has the largest area, but a small population; London has by far the smallest area, but the second largest percentage of the population - over 12 per cent. (The South East has the largest population - nearly 14 per cent.) At the other extreme, Northern Ireland has the smallest population: nearly 3 per cent of the UK total. These large variations in the regions' populations are reflected in the size of regional GVA and incomes.

The wide variation in the size of the regions makes it difficult to compare the regions' economic performance using cash totals. Comparisons are therefore usually expressed in terms of amounts per head of the population. However, it is important to note that the growth in totals may be quite different to the growth per head in regions where the population has increased or decreased. Furthermore, the level per head is determined both by the average amount of cash of the working population and by the proportion of dependants. Northern Ireland households have a high proportion of children (24 per cent of the population were aged 16 or under in 2002 compared with 20 to 22 per cent in other regions). This will tend to depress amounts per head. Ideally the age structure of the population should, therefore, be taken into account when comparing figures on a per head basis.

**Figure 6****Diversity of NUTS1 Regions****Key Regional Statistics – Percentages of the UK**

<b>Region</b>	<b>Area<sup>1</sup> 2004</b>	<b>Population<sup>2</sup> 2004</b>	<b>Total Economically Active<sup>3</sup> 2004</b>	<b>Gross Value Added<sup>4</sup> 2004</b>	<b>Individual Consumption Expenditure 1999</b>	<b>Total Household Income<sup>5</sup> 2003</b>

5 Excluding Extra-regio.

## V QUALITY ASSURANCE

ONS made a number of improvements to the processes used to calculate regional GVA in December 2005. Along with these improvements, there were some data input changes that resulted from the accompanying data analysis. This year ONS has built upon those improvements and made some data input changes.

### Quality adjustments of data inputs

In addition to quality assurance of processes, regional GVA estimates are produced following extensive quality assurance of the underlying raw data, in line with practices in place for National Accounts estimates. As part of this process a number of discrepancies were found in the raw data, which had some impact at the regional level. The following examples show how some of the arising issues were resolved.

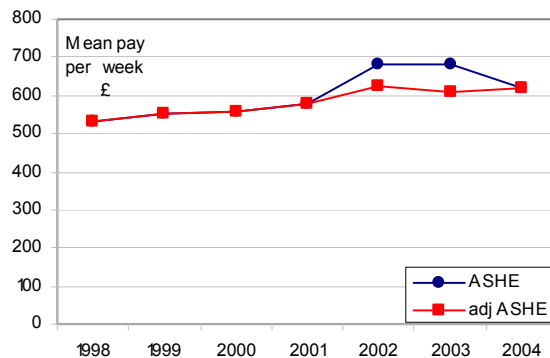

### Earnings – ASHE Data Analysis

The new ASHE methodology (referred to in the Introduction and in Section III Latest Year Estimates) was applied to all regions of the UK at NUTS1&2. The application of the new methodology caused some step changes and generally ASHE estimates are slightly higher than those directly taken from NES for the years 1998 to 2003.

Some quality adjustments were made to outliers at NUTS1. Graphical analysis helped spot outliers, for example, average weekly earnings figures that didn't follow the general trend. Information from other sources available and growth rates analysis in all regions supported decision making.

Figure 7 shows the adjustments made to male full-time pay in 2002 and 2003 in industry J (financial intermediation) for Scotland. Growth analysis, sample size and quality-measurement indicators suggest that the ASHE results for mean pay are out of sequence.

Figure 7 Quality adjustments to Male Full-time Earnings in Scotland in Industry J

At NUTS2&3 some data quality issues occurred because of a low observation count resulting in greater volatility of the series. Information on sample size and quality-measurement indicators were taken into account for adjustments to data.

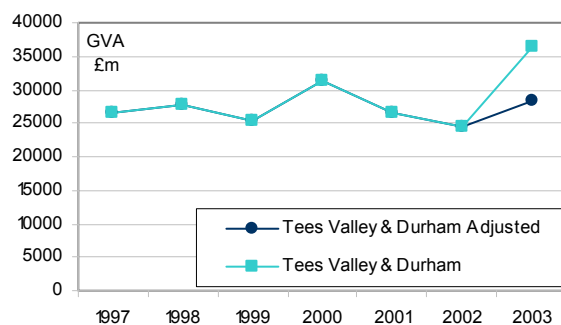

At both NUTS2&3 level, data for industry A02 (forestry), industry B (fishing), and industry C (mining and quarrying) - individually and grouped - were generally poor and were replaced with the according results at the next higher level, e.g. at NUTS1 or the UK.

### Employment - ABI1 Data Analysis

ABI1 employment data are used in the estimation of GVA at NUTS2&3 only. Adjustments are considered for all series where there are obvious outliers that are not supported by additional evidence.

Adjustments are considered for all series where there are obvious data outliers that are not supported by additional evidence. An example of one of these adjustments is shown in figure 8.

Figure 8 Adjustment to Tees Valley and Durham

The above graph shows that full-time employment in industry K (real estate renting and business activities) in the NUTS2 area Tees Valley & Durham rose 49 per cent between 2002 and 2003 (from 24,504 to 36,506).

Tees Valley & Durham, a NUTS2 area, sits in the NUTS1 region of the North East alongside the NUTS2 area of Northumberland & Tyne & Wear. Tees Valley & Durham contributed 32 per cent to North East employment in industry K while Northumberland & Tyne & Wear contributed 68 per cent in 2002. In 2003 these shares were 36 per cent and 64 per cent respectively.

Tees Valley & Durham was adjusted downwards (by 8,000) to 24,504 for 2003 in line with the 2002 proportions. This eliminated the outlying value for Tees Valley & Durham. A number of other quality adjustments were made to the data using this method.

### **Financial - ABI2 Data Analysis**

ABI2 data are used to estimate the regional allocation of Compensation of Employees (CoE) and Gross Operating Surplus (GOS) for manufacturing industries.

The ABI2 2002 and 2003 dataset, consistent with UK figures published in September 2005 was used in the production of NUTS1 GVA 1989 to 2004. ABI2 data used from 1998 to 2001 remains unchanged from that used in the December 2004 publication of regional GVA. There are some notable exceptions, where new information has become available and some small adjustments have been made. See Section VII Revisions.

As in previous years, the ABI2 dataset has been subject to thorough quality assurance procedures at all published NUTS levels. As part of this process a number of discrepancies were found in the raw data, which have had an impact at a regional level. The following examples show investigations and the resolution of a number of issues at NUTS1.

### **Quality Assurance of ABI2 Data at NUTS2&3**

ABI2 estimates take a 'top-down' approach to producing figures at lower geographical levels. The UK estimates are produced first, followed by NUTS1 estimates, then NUTS2 estimates and finally the NUTS3 estimates. Therefore, when assessing the NUTS2&3 ABI2 estimates, any quality adjustments made at NUTS1 are applied to the appropriate NUTS2&3 areas.

### **Her Majesty's Revenue and Customs Pay-As-You-Earn**

Her Majesty's Revenue and Customs Pay-As-You-Earn (HMRC PAYE) data has been quality assured against the annual survey of hours and earnings (ASHE) data and found fit for use. As planned this is the second year running that the quality assurance exercise has taken place. However, last year the New Earnings Survey (NES) was the control dataset against Inland Revenue pay-as-you-earn (IR PAYE). The NES has now been replaced by ASHE.

Prior to December 2004, the PAYE dataset had not been used in the compilation of regional (NUTS1) estimates since 1998.

The methodology used was to match individual records from the 2002/03 HMRC dataset with records from the 2003 ASHE. The latter was used as a control to determine the quality of the HMRC residence address information and assess the effect any incorrect address information may have on the HMRC regional distribution of total pay (it is this, rather than totals, that feed into ONS GVA estimates).

Analysis of the results suggested that the HMRC regional data have no serious data quality issues at NUTS1, NUTS2 or NUTS3 levels. The methods used in this report suggest between 85 and 95 per cent of the HMRC residence addresses are correct at these NUTS levels, and the regional distribution of HMRC total annual pay is, at each NUTS level, close to what it should be if all the HMRC addresses were correct (according to the ASHE).

On assessment, a quality adjustment was made to London and the South East of England. Following this adjustment the HMRC regional data are considered fit for use in the calculation of NUTS1 GVA and NUT2 and 3 GDHI. The quality adjustment is detailed in Annex C.

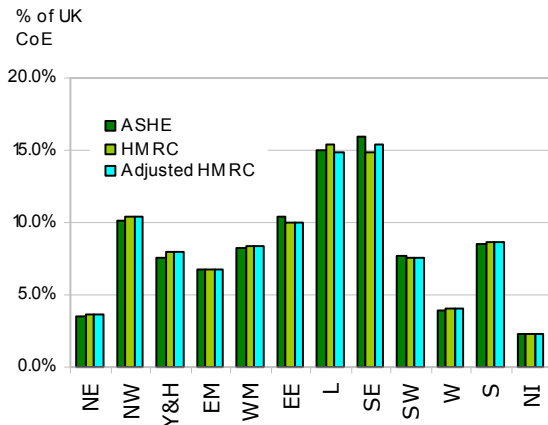

The matching exercise indicated that the HMRC PAYE dataset underestimates the number of people assigned to the South East; as a result the earnings value for the South East is lower than it should be. The PAYE address information, at an individual level, was compared to the ASHE with this forming the basis of the adjustment. A number of individuals and their estimated earnings were 'moved' from London to the South East.

The adjustment was then extended to the data where there was no equivalent information (unmatched data) leading to an upwards adjustment of CoE in the South East and downward adjustment in London.

For 2002/03 PAYE data, 2.9 per cent of the earnings assigned to London were removed from London and added to the South East. This is 0.48 per cent of the UK

total. See Section VI Revisions for more details of how this affects data from 1997.

Figure 9 Regional UK total pay 2002/03 PAYE matched with ASHE 2003 before and after adjustment

It is proposed that the exercise is repeated annually until a time series can be created to give a consistent adjustment over time with the proposal above re-assessed in the light of new results.

## VI REVISIONS

This part of the article compares the current regional GVA estimates for 1989 to 2003 at the NUTS1 level to the previous dataset published in December 2004 and subsequently in the March 2005 edition of Economic Trends. A detailed analysis can be found in Annex A.

### NUTS 1

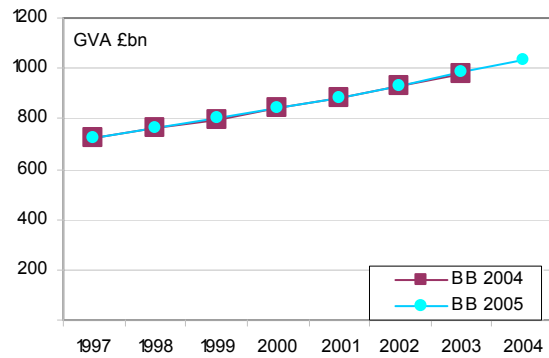

The main reasons for revisions since the December 2004 NUTS1 regional publication are:

- Revisions to national controls (*Blue Book 2005*)
- Revised HMRC PAYE data for 2002/03
- Revisions to 1998 to 2003 NES dataset using new ASHE methodology from 2004.

## Revisions to National Controls

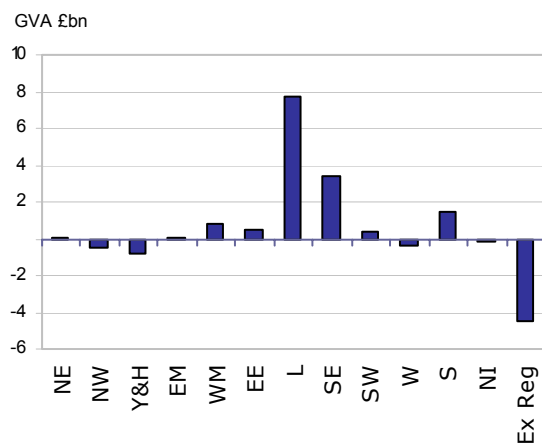

The National Accounts *Blue Book* publication for 2005 included revisions from 1991 onwards.

Figure 10 UK GVA in *Blue Book 2004* and *Blue Book 2005*

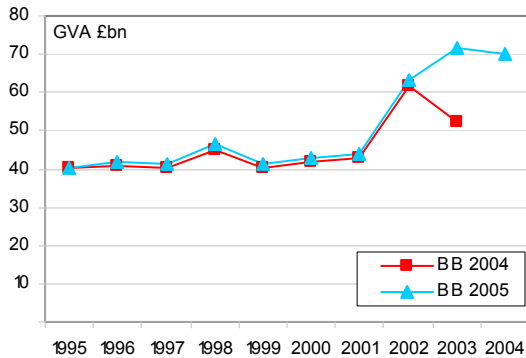

At an industry level there were also a number of large revisions impacting on the regional allocation of GVA.

Figure 11 *Blue Book 2005* Revisions Impact on Regional GVA

This is particularly evident for industry J (financial intermediation) 2003 where the previously unbalanced figure of £52 billion (+/- subsidies) (*Blue Book 2004*) was revised to £72 billion (+/- subsidies) (*Blue Book 2005*) as a result of a differing methodologies between the two estimates. See figure 12 below.

Figure 12 UK Financial Intermediation in *Blue Book 2004* and *Blue Book 2005*

As a result of this, at a regional level, London had the largest revision in 2003. The city receives the largest share of financial intermediation in the UK; its GVA was therefore revised upwards accordingly by £7.8 billion (+/- subsidies).

Figure 13 Financial Intermediation - Impact on London GVA

London's overall GVA growth of 5.8 per cent equated to an increase of £8.8 billion between 2002 and 2003. Most of this growth is due to the increase in industry J (financial intermediation).

Extra-region was revised downwards by £4.6 billion in 2003. This was caused by the change to the national control for 'extraction of mineral oil and natural gas', the majority of which is not allocated to any region because most oil and gas extraction takes place "off shore". The downward 2003 revision was from £24.9 billion (*Blue Book 2004*) to £20.2 billion (*Blue Book 2005*). See figure 14.

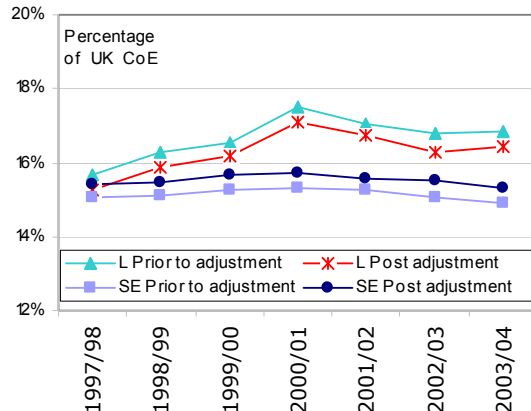

Figure 14 Oil & Gas Extraction in *Blue Book 2004* and *Blue Book 2005*

### Revisions to Inland Revenue Data

As mentioned above, the ONS carried out a data matching exercise to assess the quality of the HMRC PAYE data. Data from 1997 to 2003/04 are considered for use in the calculation of regional GVA by ONS directors following the adjustments specified in Annex C. The adjustment as shown for the 2002/03 data in Section V Quality Assurance is shown below once applied to the whole dataset for 1997/98 to 2003/04

Figure 15 London and South East Prior and Post Adjustment

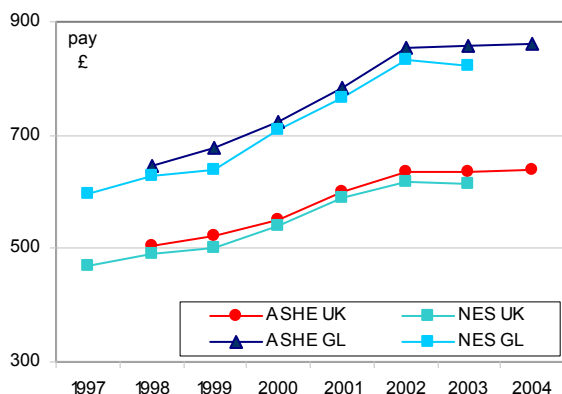

### Revisions to NES (ASHE)

Estimates of average weekly pay using the ASHE methodology are higher than those taken directly from New Earnings Survey (NES) for 1998 to 2003. Overall the increase is higher for men than for women. Estimates of earnings for people in London increased by more than estimates for other regions. For example, male full-time employee's weekly average earnings in industry K (real estate, renting and business activities) according to NES in 1998 were £492 for the UK but £626

for Greater London. Applying new ASHE methodology results, this figure rose by £14 to £506 in the UK and by £20 to £646 for Greater London.

**Figure 16 ASHE vs. NES - Male Full-timers in Industry K**

### Revisions to ABI2

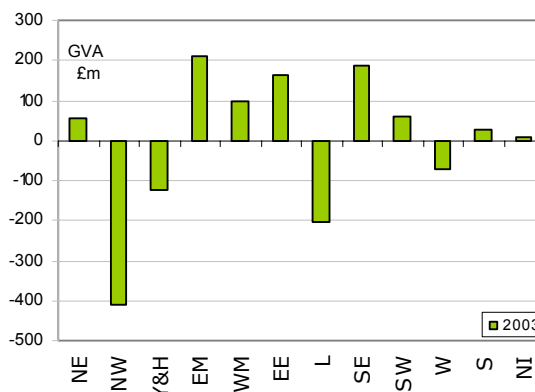

ABI2 results are primarily used to calculate the regional allocation of GVA within manufacturing industries. In September 2005 ABI2 revised data for 2002 and provisional data for 2003 was published. The latest regional GVA estimates are consistent with ABI2 indicators except for small adjustments based on recent information.

During the production of regional GVA estimates, published in December 2004, a series of quality adjustments were made to a number of indicator datasets. One of those was to a manufacturing sub sector in the North East, where an adjustment was made to the ABI2 data. Revised ABI2 data and new data for 2003, along with evidence from the company involved, have confirmed the original data to be correct therefore the adjustment for 2002 has been removed.

### Revisions to STES

Regional estimates of GVA incorporate revisions to STES for 2003.

**Figure 17 Impact of Revised STES on NUTS 1 GVA**

Revised 2003 STES data had the biggest impact on the North West with a downwards revision of £0.4 billion. The number of males in full-time employment in industry E (electricity, gas and water supply) was revised down from 7,100 to 5,600 while female full-time employment was revised from 4,700 to 2,400.

### NUTS 2 and 3 Revisions

The methodology for estimation of NUTS2&3 regional GVA estimates are reliant on the availability of accurate estimates of NUTS1 GVA. Therefore many revisions at NUTS2&3 are a direct result of the NUTS1 GVA estimates.

The main revisions at NUTS2, compared to December 2004 are due to:

- Revisions to Blue Book 2005 and Blue Book 2004
- Revisions to ABI2 data.
- Revised employment data from the ABI1.
- Revisions as a result of the new ASHE methodology.

The main cause of revisions at NUTS2&3 levels are revised national controls from Blue Book 2005 and the incorporation of revisions from the NUTS1 GVA estimates, for example the introduction of ASHE data. The new ASHE methodology was applied to all NUTS2&3 regions results from the New Earnings Survey (NES) back to 1998.

Overall, revisions due to ASHE are roughly in line with Blue Book revisions. Within NUTS3 area, Outer London, the regional GVA of Outer London South was revised up by 2.1 per cent, of which 1.5 percentage points were attributed to ASHE. This was due to higher estimates for average earnings in the services industries. However,

there were a few exceptions where the impact of the new ASHE results was more noticeable because of a ratio of total GVA to population, e.g., Darlington, Plymouth and the Shetland Islands.

## VIII FUTURE WORK PLANS

Current plans are for the regional GVA estimates for 2005 to be published in December 2006, and will take on board the revisions outlined below. Publication of regional GVA is linked to the production of the National Accounts annual Blue Book. The Blue Book is generally published six months after the end of the period to which it relates, although the latest year will not be balanced through the supply-use framework. Regional GVA data consistent with the Blue Book national control totals are then published a further six months after the Blue Book publication. Blue Book 2006 (i.e. with annual data up to 2005) is due to be published at the end of June 2006.

Estimates of sub-regional GVA for 1995 to 2004, with figures for the UK broken down into the 37 NUTS2 and 133 NUTS3 areas, are also due to be published in December 2006.

Estimates of regional gross domestic household income (GDHI), for 1995 to 2004, are planned for publication in early 2006 consistent with the national household income estimates published in Blue Book 2005.

Due to conceptual problems with current expenditure variables, the publication of regional gross fixed capital formation (GFCF) estimates has been suspended.

### Further work for 2005 GVA dataset

The following revised datasets will become available between publication of the current regional GVA estimates and the 2005 regional GVA dataset:

- The annual Blue Book will be published at the end of June 2006. This will contain revisions to UK control totals for the income components of GVA.
- Revised ABI2 data will be published in July 2006 and will be consistent with the data underlying the Blue Book publication.

- New and revised estimates of earnings from ASHE, along with employment estimates from STES and ABI1 will be published during 2006.

### Wages and salaries data from Inland Revenue

As mentioned above the quality assessment of the PAYE data provided a successful conclusion with data deemed fit for purpose, with some adjustment. It is planned that this exercise will be carried out again in 2006, matching PAYE data for 2003/04 against the ASHE data for 2004. Part of the conclusion of the original exercise was the need to repeat the work on a regular basis to ensure the validity of the results over time.

### Plans for further methods and data source improvements

#### i) Further use of ABI1 and ABI2 data

Annual Census of Production (ACOP) data have been used to regionally allocate wages and salaries, and gross operating surplus (GOS), for the production industries up to 1997. Service industry national control totals for both of these components were allocated for these years using estimates of wages and salaries derived from the NES and STES, as there was no equivalent to ACOP for the service industries. The ABI2 now provides regional data on CoE and proxies for profits for both the production and most service industries from 1998. The regional GVA production team plan to assess the ABI2 regional service industries data as a possible replacement for the current data sources. It is likely that the ABI2 results for service industries will need extensive quality assurance before use.

#### ii) Commuting patterns

Information on commuting patterns is used to derive the workplace-based estimates of regional GVA. When 2001 Census travel-to-work data become available, it is planned to investigate the commuting patterns between regions. The purpose of this proposed work is to test, and if necessary update, the current assumption that the only significant net commuting between NUTS1 regions is between London, the South East and the East of England. The investigations will show if and how commuting patterns have changed and determine which regions now experience a significant degree of net commuting.

## **VII CONCLUSIONS**

The main conclusions to be drawn from this article are:

- The major drivers behind the majority of the changes or growth rates are due to the latest UK GVA estimates and the use of HMRC PAYE. The PAYE data is used for the second time in the estimation of regional GVA.
- AT an industry level "Financial Intermediation" (industry J) has had the greatest effect on revisions at NUTS1 and the greatest impact at NUTS2&3 for the 2003 reference year.

## Annex B - Background Notes

### 1 European System of Accounts 1995 (ESA95)

The estimates of GVA published in this article are consistent with the *European System of Accounts 1995 (ESA95)*. ESA95 is based on the *System of National Accounts 1993 (SNA3)* which was sponsored by all major international organisations and is being adopted world-wide. The European system, which is being adopted by European Member States, is consistent with SNA93 but is more specific and prescriptive in certain parts. Introducing the *European System of Accounts 1995, National Accounts Concepts, Sources and Methods (1998)*, and *Regional Accounts Methods* give more detail of the changed system of accounts, and the particular effects on the UK.

### 2 Regional GVA at basic prices

The NUTS2&3 1995 to 2003 final estimates published in this article are consistent with estimates of UK GVA published in *United Kingdom National Accounts Blue Book 2005*, NUTS1 1989 to 2003 GVA estimates with *Blue Book 2005*, and NUTS1 2004 provisional GVA estimates with *Blue Book 2005*. The Blue Book also defines the terms used.

Under ESA95, the term gross value added (GVA) is used to denote estimates that were previously known as gross domestic product (GDP) at basic prices. Under ESA95 the term GDP denotes GVA plus taxes (less subsidies) on products, i.e. at market prices. Regional accounts are currently only published at basic prices, so the figures are referred to as GVA rather than GDP.

### 3 Geography

The Nomenclature of Units for Territorial Statistics (NUTS) provides a single uniform breakdown for the production of regional statistics for the European Union. There are five levels of NUTS in the UK, although GVA estimates are only published for the first three. These are:

NUTS1 - Government Office Regions and Scotland, Wales and Northern Ireland.

NUTS2 - 37 areas within the United Kingdom.

NUTS3 - 133 areas, generally groups of unitary authorities or districts, also known as local areas.

Some areas appear at more than one level, for example, Northern Ireland appears at NUTS levels 1 and 2.

The GVA estimates relate to the nine Government Office Regions of England, as well as totals for Scotland, Wales and Northern Ireland. These form level 1 of the NUTS geography described above.

### 4 Regional GVA – concepts and definitions

In this article GVA is measured as the sum of incomes earned from the production of goods and services in the region. Insufficient information is available to estimate GVA for all regions of the UK using either the production or the expenditure approaches. Estimates of GDP for Scotland only, based on the production approach, and measured in terms of constant (real) prices are published quarterly by the Scottish Executive. An article detailing the methodologies can be found in *Scottish Economic Statistics*, 2001 edition.

As described above, the estimates of regional GVA in this article are calculated as the sum of incomes earned from productive activity in the region. The income (referred to as CoE under ESA95) of commuters should therefore be included in the region where they work. Historically, however, the estimates of regional GVA have not been compiled on this basis; but have instead been compiled using regional estimates of CoE on a residence basis, because this was the basis of the most reliable data source (the one per cent sample of Inland Revenue national insurance records). This has a significant effect on the estimates for London, the South East and the East of England regions, but is assumed not to introduce any significant distortion of the other regions. Estimates of GVA on a residence basis are given in tables NUTS1:1 to 8 of this article.

Figures allocating the CoE to employee's workplace (the preferred GVA approach) are also included in this article, in table NUTS1:4. The workplace-based CoE figures for London, the South East and the East of England are based on regional data from the STES and the ASHE/NES. There is, however, no industry breakdown currently available on a workplace basis.

Unless otherwise stated, all references in this article to regional GVA refer to residence-based figures.

### 5 Methodology

Sampling and non-sampling errors in the raw data sources used for regional accounts at a regional level give rise to the volatility in the regional GVA data. The

regional GVA series headlined in this publication have been calculated using a five point moving average. These adjusted series remove some year to year volatility in the unadjusted series.

The underlying raw regional GVA estimates were produced using the same methodology as previous estimates – with the exception of a change to the methodology used for allocation of FISIM industries. The methodology used to produce the raw regional GVA estimates was published in the December 2000 edition of Economic Trends. Previously, FISIM was allocated to the regions using numbers of people employed in the Financial Intermediation sector. This makes the FISIM methodology consistent with the allocation of other components of Financial Intermediation.

## **6 Extra-regio**

The contribution to GVA of UK embassies abroad and UK forces stationed overseas is included in Extra-regio, along with the element of GVA relating to activities taking place on the continental shelf. As these cannot be assigned to specific regions they are assigned as “Extra-regio GVA”.

## **7 Treatment of commuting in regional GVA estimates**

Regional GVA can be calculated both on a residence and a workplace basis. Residence-based GVA allocates the incomes of commuters to where they live, whereas workplace GVA allocates their incomes to where they work. The GVA estimates presented here are on a residence basis; and the breakdown of the totals by components of income and by industry are currently only available on a residence basis. However, workplace estimates are also provided in table NUTS1:4. The residence and workplace estimates are different from each other only in the regions of London, the South East and East of England. For all other regions it has been previously determined from the Census of Population that net commuting between the regions is not significant.

## **8 Allsopp Review**

In March 2004, the final report of Christopher Allsopp’s review of statistics for monetary and wider economic policymaking was published. Its remit was to examine the provision of data required for regional economic policy making and to assess how

well the provision of economic statistics captures structural change in the economy.

The ONS has welcomed the recommendations from the Allsopp Review and has committed to implementing improvements through a dedicated team and programme. The Programme delivery flows from the development of the Business Register to the development and expansion of new and improved surveys, followed by the processes and analysis to produce the new Regional Accounts using the production approach.

## **9 General**

All the items in the regional accounts are measured in current prices, which mean increases over time reflect inflation as well as growth. Trends in total GVA per head of population cannot be analysed easily without deflating the data. However, there are no regional price indices that could be used to remove the effect of inflation from the figures. Comparisons of trends can be based either on the difference between regional increases at current prices or on movements in the amount relative to the UK average. Both approaches would be misleading if the rate of inflation in any region were different from the national average.

In the regional accounts it is usual to look at changes per head relative to the UK average over time. However, this obscures the effect of changes to the population size. In areas where the population is increasing most rapidly, growth in total GVA would be expected to grow relatively strongly; conversely, areas with a low or negative population growth would be expected to grow more slowly.

1989 to 2004 regional GVA per head of population figures will feed into the regional growth baselines calculated for the regional economic performance PSA target, jointly shared DTI, HMT and ODPM. However, the regional GVA figures do not take account of the impact of price inflation at either the national or regional level. Due to this, the growth rates in this current price GVA per head of population series will not necessarily be comparable with any forthcoming regional growth baselines that will be set for this PSA target. The latter will be adjusted by statisticians in the DTI to take account of the impact of inflation at the regional level.

## **10 Toll processing**

Toll processing is when a service is performed on a customer’s product for a fee. It is complicated because it has been happening increasingly across the UK / Rest of the World boundary. For example, when companies move production functions abroad but retain ownership of the goods. As the ABI questionnaire does not cover

companies registered overseas with a UK VAT reference this process is missed.

### 11 Accuracy

Although calculated as reliably as possible, estimates of regional GVA will not be as reliable as those for national GVA.

The regional GVA estimates are partly based on sample surveys and the quality of the results therefore varies according to sample size.

This means, for example, that results at NUTS3 are more likely to be subject to a greater degree of uncertainty than those at NUTS1. In particular, there remains a margin of uncertainty regarding the accuracy of reported data. The finer the level of geographic detail sought the greater the likelihood of misallocation. Enterprises are encouraged to make their best estimates when asked to report geographical data, but as regional lower level geographic allocation may not be a crucial aspect of the information from which details are extracted, a significant degree of estimation may occur.

This article contains only a summary of the information available. A more detailed breakdown of manufacturing, and total regional CoE information are available on request from: Customer Contact Centre, Office for National Statistics, 1 Drummond Gate, London SW1V 2QQ, Tel: 0845 601 3034, fax: 01633 652 747, email: [info@statistics.gov.uk](mailto:info@statistics.gov.uk)

Details of the policy governing the release of new data are available from the Press Office.

STES	Short-Term Employment Survey

## HM Revenue and Customs Pay-As-You-Earn Quality Assessment

### **Executive summary**

- This report presents the results of the project carried out by ONS Regional Accounts to assess the quality of the regional address information on Her Majesty's Revenue and Customs' (HMRC) pay-as-you-earn (PAYE) dataset. This dataset is used by ONS Regional Accounts to compile estimates of NUTS1 gross value added (GVA) and NUTS2-3 gross disposable household income (GDHI).
- This exercise has been carried out following concerns that the address information on the HMRC dataset is not up to date. The HMRC (previously Inland Revenue) data was not used for estimates from 1997 until 2003 following the change in the HMRC database from NIRS (National Insurance Recording System) to NIRS2.
- The methodology used was matching individual records from the 2002/03 HMRC dataset with records from the 2003 Annual Survey of Hours and Earnings (ASHE). The latter was used as a control to determine the quality of the HMRC residence address information and assess the effect any incorrect address information may have on the HMRC regional distribution of total pay (it is this, rather than totals, that feed into regional accounts' estimates).
- Analysis of the results suggested that the HMRC regional data have no serious data quality issues at NUTS1, 2 or 3 levels. The methods used in this report suggest between 85 and 95 per cent of the HMRC residence addresses are correct at these NUTS levels, and the regional distribution of HMRC total annual pay is, at each NUTS level, close to what it should be if all the HMRC addresses were correct (according to the ASHE).
- It is proposed that a quality adjustment should be made to London and the South East regions of England; following this the HMRC regional data are suitable for use in the estimates of NUTS1 GVA and NUTS2-3 GDHI. The quality adjustment is detailed in section 4.
- It is further proposed that the exercise is repeated annually until a time series can be created to give a consistent adjustment over time with the proposal above re-assessed in the light of new results.

### **1. Introduction**

#### **1.1 Report content**

This report sets out the results of the matching exercise carried out by ONS Regional Accounts to quality assure the address information on HMRC PAYE dataset. This dataset is currently used by ONS Regional Accounts in the compilation of estimates of NUTS1 GVA and NUTS2 and 3 GDHI. The report summarises the methodology and sets out the core results leading to the recommendation that HMRC data

## ANNEX C

continues to be used in the compilation of these key outputs subject to a quality adjustment. The report sets out the adjustment recommended by ONS Regional Accounts and Methodology Directorate.

### 1.2 Background

HMRC residence-based PAYE data are used to apportion National Accounts Input-Output compensation of employees (CoE) totals by Industry to NUTS1 regions in the compilation of NUTS1 GVA and in deriving estimates of NUTS2 and 3 GDHI. CoE accounts for about two-thirds of regional GVA and is the largest single component of GDHI.

Following a change in the Inland Revenue (now HMRC) database of national insurance information from NIRS to NIRS2 the Inland Revenue (IR) data were no longer used. This was due to concerns from peer reviewers<sup>1</sup> and within ONS Regional Accounts about the accuracy of the residence address information. The concern was that IR was not picking up the latest addresses for people who had recently moved. It was decided that the best way to assess the quality of the address information on the IR dataset would be to carry out a project to match, on an individual case basis, the IR dataset to an equivalent dataset elsewhere. The New Earnings Survey (NES) was determined to provide a suitable control as it is based on the same sample as the IR dataset - National Insurance numbers (NINOs) ending in two particular digits. This matching exercise was carried out in 2004.

Prior to this matching exercise the IR data were only directly used for regional GVA for the period up to 1996. From 1997 onwards the NES average earnings data multiplied by Short-Term Employment Survey (STES) was used. The growth rate of this was used to project forward the IR controls. IR controls were used for GDHI up to the March 2002 publication (reference year 1999). The IR controls were reintroduced for the GVA publication in December 2004 and GDHI publication in April 2005 after the following recommendation from the 2004 matching exercise:

**“Based on the results of the matching exercise, ONS Regional Accounts recommend that the Inland Revenue data be used in the calculation of NUTS1 estimates of GVA and NUTS1-3 estimates of GDHI.**

It is also recommended that this project be re-assessed next year (2005) to ensure the accuracy of the Inland Revenue data based on two separate years.”

This paper sets out the results of the second of these recommendations, with changes to data sources taken into account. The NES has now been replaced by the Annual Survey of Hours and Earnings (ASHE). This new survey is ‘grossed up’ taking into account the number of people in employment according to the Labour Force Survey and hence gives revised regional estimates. However, at an individual level it has the same sample as the NES so was used in its place in the 2005 matching exercise.

## ANNEX C

Revised HMRC data up to 2002-03 were made available to ONS Regional Accounts in April 2005 following extensive quality assurance work by HMRC and the Department for Work and Pensions.

### **1.3 Aim of the project**

The project was intended to provide an additional assessment of whether HMRC regional data are of sufficient quality to be used in regional accounts' production processes in the future. The ASHE asks the employer for the employee's residence address, which is then used as the comparison "control" to ascertain the accuracy of the HMRC data. The project was not questioning or assessing the accuracy of the survey data. The ASHE address information is assumed to be reliable.

The project also aimed to determine whether an appropriate adjustment could improve the quality of the data and, if so, what regions should be adjusted and how the adjustments should be carried out. This was done first at the NUTS1 level and then at the NUTS2 and 3 levels.

## **2. Summary of methodology**

### **2.1 Data matching methodology**

The project matches individual records from the HMRC dataset with individual records from the ASHE dataset. These data are still covered under the Statistics of Trade Act 1947 and therefore, complete confidentiality has been adhered to in order to complete the project. The project was carried out in accordance with the ONS' Microdata release protocol. All results have been aggregated in order to avoid any issues with disclosure that may arise.

The project cannot definitively prove that the HMRC regional data are accurate. Instead, the approach taken was to begin with a "null hypothesis" that the HMRC data are of suitable quality. Only if analysis produced a significant reason or reasons to indicate that the HMRC data are incorrect in some way would the null hypothesis be rejected in favour of the conclusion that the HMRC data are not of suitable quality.

### **Dataset preparation**

ASHE data for 2000, 2001, 2002 and 2003 and HMRC data for 1999-00, 2000-01, 2001-02, 2002-03 were available including the ASHE data for Northern Ireland, as provided by the Northern Ireland Statistics and Research Agency. All unwanted variables were removed keeping only NINO, residence address (and workplace on the ASHE), annual pay, age (HMRC only), date of death (HMRC only) and Standard Industrial Classification (SIC) code.

The NINOs were compressed to eliminate any spaces and make sure the variable was in the same format on both datasets. The NINO suffix was also removed (i.e. the letter at the end of the NINO) as these were not provided on the ASHE dataset (the NINO is still unique without the NINO suffix). Where a NINO occurred more than once on a dataset the records were combined to give total annual pay, industry code from the

## ANNEX C

largest contribution to pay and the most recent address information. This meant the NINO was a unique identifier on each dataset representing a person rather than a job. In the HMRC dataset all the obvious temporary and dummy NINOs were removed - these records referred to employees with unknown NINOs or temporary employees. There was no address information for any of the records with temporary and dummy NINOs. For the remainder of this report any reference to the HMRC or ASHE datasets refers to these cleaned datasets ready for matching.

### Matching the datasets

The ASHE and HMRC datasets were matched by NINO with each NINO occurring only once on each dataset. Therefore, the matching was one to one. A deterministic matching technique was used; if and only if, the NINOs were identical the records on the ASHE and HMRC merged. No other variables were used in the matching.

The ASHE 2003 data was matched with the HMRC 2002-03 because the ASHE is collected at the end of the tax year and, therefore, corresponds best with the records from the preceding tax year on the ASHE. The table below shows which ASHE and HMRC datasets were matched:

HMRC dataset	ASHE dataset
1999/00	2000
2000/01	2001
2001/02	2002
2002/03	2003

Once the datasets were matched three new sets of records were produced for each year:

1. All those records that appear on both datasets (“Matched data”)
2. HMRC records that were not on the ASHE dataset (“Unmatched HMRC”)
3. ASHE records that are not on the HMRC dataset (“Unmatched ASHE”)

The results below focus on the matching between the HMRC 2002-03 data and the ASHE 2003 data. Matching, for all the other years, was repeated to ensure there were no major changes in the revised data and that results were compared consistently over a period of time.

### 2.2 Analysing the data

This section explains the analysis carried out on the matched and unmatched records. The results of this analysis are presented in section 3. ONS Regional Accounts liaised closely with ONS’ Methodology Directorate for guidance in the analysis stages.

#### HMRC residence vs. ASHE residence

The primary aim of the analysis was to compare, at each NUTS level, the HMRC residence address information with the ASHE residence address information in order to ascertain the quality of address information on the HMRC dataset. A question asking for residence address was introduced onto the ASHE in 2001 enabling comparison of residence address information with the HMRC data. It was

## ANNEX C

experimental for the first year so only the 2002 and 2003 information is considered reliable. The main objective was to determine how many of the HMRC addresses appear to be correct and if there was any coherent pattern of bias among addresses that were wrong. The effect of incorrect addresses on the proportion of HMRC total pay assigned to each region was considered as it is this, rather than the actual totals, that feeds into GVA and GDHI estimates. A perceived bias in the HMRC address information was not a problem as long as its effect on the regional distribution of HMRC pay is nil or negligible.

The matched data could be analysed more easily, as in the majority of cases each HMRC record had a corresponding ASHE record with address information, which could be compared to find out if the HMRC address was “correct” according to the ASHE.

For the purposes of this project an HMRC residence address is defined as “correct” if it is in the same NUTS region as the address specified on the ASHE dataset.

The unmatched data (44 per cent of HMRC 2002/03 data and 4 per cent of ASHE 2003 data) had no immediate match for a comparison so a different approach was required. The first stage was to see if differences occurred in the characteristics of the unmatched people, and where they did what this meant about the accuracy of the address information. It was also important to know what effect differences had on the total pay by region. It was useful to learn the reasons for records being unmatched in order to know whether they were likely to imply a data quality issue.

It was possible to find out if the unmatched records had been matched in previous years. Where this was found to be the case the quality of the address match for these records could be checked from the year when the record was matched. Although not a definitive answer about the present address being correct it indicated that the record is not erroneous and should be accepted as correct.

For the data from the unmatched dataset that could not be matched with any other year, an approach similar to that used in the 2004 matching exercise was adopted. A new dataset was created by “simulating” the unmatched data. A subset of 20,000 records, with the same characteristics as those never matched on the ASHE in any year, was taken from the matched dataset. The three variables used to indicate the groupings were; region, industry and pay. These were split into strata as shown in the table:

<b>Variable</b>	<b>Groupings</b>		
Region	UKI - London	UKJ – South East	Other
Industry	H and K (Hotels & restaurants and Real estate, renting & business activities)	M and N (Education and Health & social work)	Other
Annual Pay	Less than or = £10,000	More than £10,000	

This meant that there were 18 (= 3 x 3 x 2) strata with the appropriate proportion of records taken from each one. The records were chosen by assigning a random number to each record and using the required number of records with the lowest random values in the simulated sample. As the records were chosen with the appropriate

## ANNEX C

characteristics it was reasonable to assume that the accuracy of the address information on this simulated dataset should be similar to the accuracy on the unmatched dataset.

Analysis of the HMRC dataset as a whole could be done by combining the results for the various elements that make up the HMRC dataset (the matched data and the different unmatched datasets) to give an indication of the overall accuracy of the dataset.

More information about the accuracy of the address on the unmatched datasets could be gained by looking at the HMRC 2001-02 unmatched data. For this dataset there are some individuals who have a corresponding record on the ASHE in 2003. It is possible to see how closely the records from the HMRC in 2001-02 relate to the ASHE in 2003. If there are not many records where the address changed between the 2001-02 tax year and the 2002-03 tax year and most of the addresses for this set of individuals on the HMRC 2002-03 are “correct”, it indicates that the quality of the residence address on the unmatched records is no worse than that of the matched records.

### **NUTS aggregation**

The regional accounts estimates of GVA and GDHI are compiled using raw input data aggregated to NUTS1, 2 and 3 levels. For the purposes of regional accounts it does not matter if the address is identical, as long as the address lies in the same NUTS region on the HMRC and ASHE datasets. This also means some HMRC addresses may be defined as correct at NUTS1 level, but incorrect at NUTS2 or 3 levels. Each NUTS level is assessed separately, with the greatest focus on the NUTS1 level.

## **3. Results**

This section presents the results of the matching for the HMRC residence address information at each NUTS level 1-3.

### **3.1 Quality of the match**

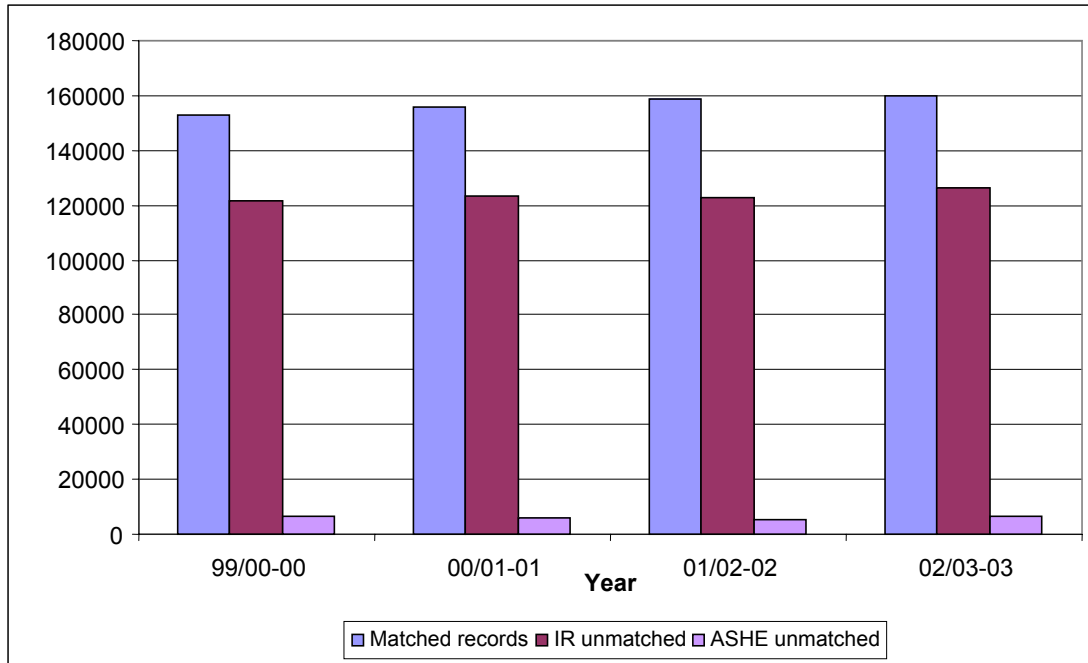

On the HMRC 2002-03 data, 56 per cent of the records are matched with the ASHE 2003; it would be difficult to match many more as these account for nearly all of the ASHE records (96 per cent). The HMRC useable dataset was much larger than the ASHE, despite the original sample being the same, because the ASHE is reduced by survey non-response and exemptions. In 2003 only 88 per cent of the surveys had a response which left a useable sample of 68 per cent once exemptions were taken into account.

Some possible causes of exemption are a person having an occupational pension or being a non-salaried director. The biggest number of exemptions is caused by those people who have left their job between the sample selection in February and the sample collection in April. (See Appendix B for more details).

## ANNEX C

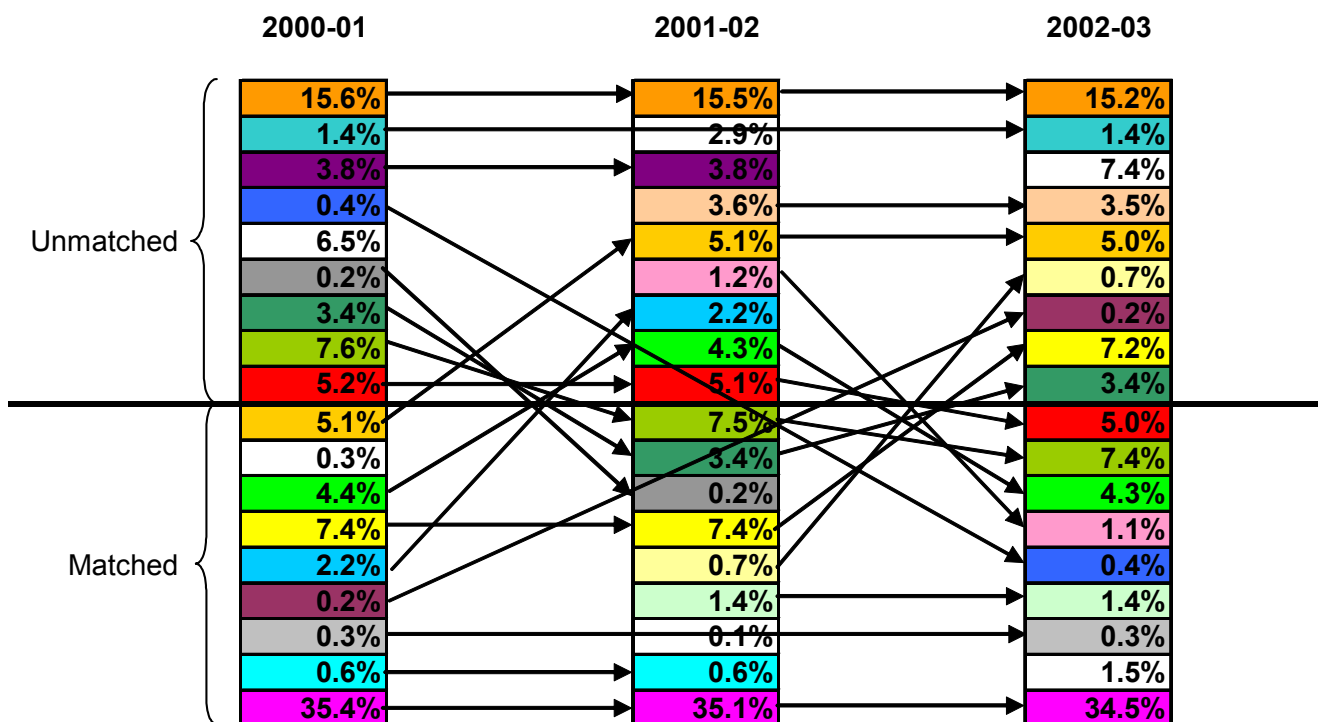

Figure 3.1 shows the number of people on the matched and unmatched datasets in each of the years the matching was carried out. The results are similar in all years.

Figure 3.1: Number of individuals matched and unmatched on HMRC and ASHE datasets.

Some of the people who appear in the unmatched HMRC dataset in 2002-03 are matched in 2001-02 or 2000-01. This accounts for 16 per cent of the HMRC records leaving only 28 per cent of individuals who are never matched.

Figure 3.2: Percentage of HMRC records (by year) matched and unmatched

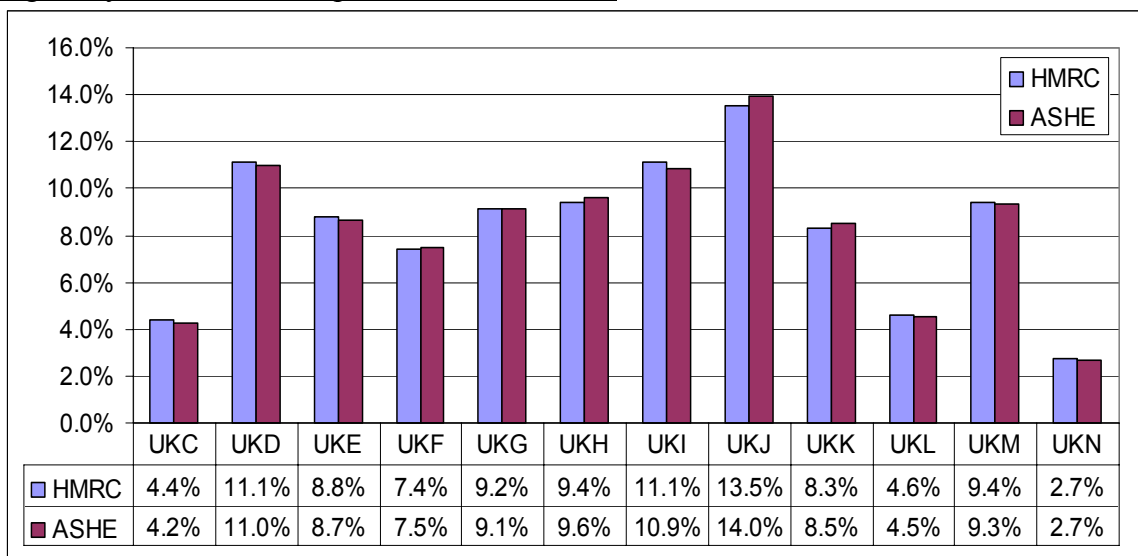

## ANNEX C

The individuals from the HMRC who are in the unmatched dataset have different characteristics to those with a matching record on the ASHE. For example, they are more likely to be under thirty or over sixty; a higher proportion of them live in London, they are more likely to work in Sector H: Hotels and Restaurants and Sector K: Real estate, renting & business activities (which would include agency workers) and, on average, the wages of these people are lower. This can be seen in more detail in Appendix B. These differences make it harder to determine the level of accuracy of the unmatched records. It is also difficult to make assumptions about the accuracy of the address because a common reason for records being unmatched is people having moved jobs, which implies these people are more likely to have changed residence address. Therefore, it could be argued there is an increased chance the address information is out of date. However, there is no more reason to think the address information for the preceding year is any less accurate than it is for those people with the same characteristics who appear on the matched dataset. It is the address information for the majority of the year that is important, not the address they have moved to for the last month of the year; therefore, it should be no worse than the matched records. Further analysis (see Appendix B) does not give any evidence to suggest the address information is less accurate.

### 3.2 NUTS1

For the records with a residence address on both datasets (i.e. not including any records where an address has not been specified) 92.5 per cent of the matched records were in the same NUTS1 region on both datasets. Even when the records with some address information missing are included, 90 per cent of the matched records have the same address at the NUTS1 level. It is reasonable to assume that the 92.5 per cent of records are accurate for all the matched data as the address is equally likely to be accurate even though it is not specified on one dataset.

Figure 3.3: Proportion of individuals from the matched records assigned to each region by the HMRC compared with the ASHE.

The information about the accuracy of these matched records can be combined with the information about the unmatched data that has been matched in the past and the

## ANNEX C

simulated dataset for the records that are never matched, to give an estimate of the accuracy of the address information on the whole dataset:

NUTS1				per cent of total records on HMRC dataset	per cent records with the same address on both datasets
Matched 2002-03				56.0 %	92.5 %
Unmatched 2002-03	Matched 2000-01		Unmatched 2001-02	5.0 %	91.0 %
			Not on 2001-02	0.2 %	90.2 %
	Matched 2001-02			7.2 %	92.7 %
			Unmatched 2000-01	3.4 %	90.9 %
			Not on 2000-01	0.7 %	92.1 %
Never matched				27.6 %	93.4 %

This indicates  $(56.0 \times 92.5) + (5.0 \times 91.0) + (0.2 \times 90.2) + (7.2 \times 92.7) + (3.4 \times 90.9) + (0.7 \times 92.1) + (27.6 \times 93.4) = \mathbf{92.6 \text{ per cent}}$  of records are correct, having the same address on the HMRC and ASHE datasets at NUTS1 level.

The evidence strongly points to the accuracy of the HMRC addresses. Therefore, ONS Regional Accounts believe the HMRC PAYE data should be used in the production of GVA estimates subject to the further investigation in section 4.

### 3.3 NUTS2

At the NUTS2 level, when the residence address is valid on the HMRC and the ASHE, 89.2 per cent of the matched records were assigned to the same NUTS region on both datasets. When the records from the data matched in other years and the information from the simulation are included this gives:

$$(56.0 \times 89.2) + (5.0 \times 87.8) + (0.2 \times 86.2) + (7.2 \times 89.5) + (3.4 \times 87.4) + (0.7 \times 89.9) + (27.6 \times 90.3) = \mathbf{89.4 \text{ per cent}}$$

This is, as expected, less than at the higher level of geography, but still a high percentage of HMRC residence addresses estimated to be correct. Therefore, ONS Regional Accounts recommend the use of HMRC PAYE data in the compilation of NUTS2 GDHI estimates.

### 3.4 NUTS3

Of the matched records with valid residence address on both datasets 85.1 per cent have the correct address at the NUTS3 level. Using the method above, it can be estimated that 85.5 per cent of the records are correct at the NUTS3 level.

$$(47.6 \times 85.1) + (4.2 \times 83.9) + (6.2 \times 86.2) + (0.1 \times 81.9) + (2.8 \times 84.0) + (0.6 \times 87.4) + (23.8 \times 68.4) = \mathbf{85.5 \text{ per cent}}$$

## ANNEX C

This is a proportion of correct addresses; Therefore, ONS Regional Accounts recommends the use of the NUTS3 PAYE data in the production of GDHI estimates.

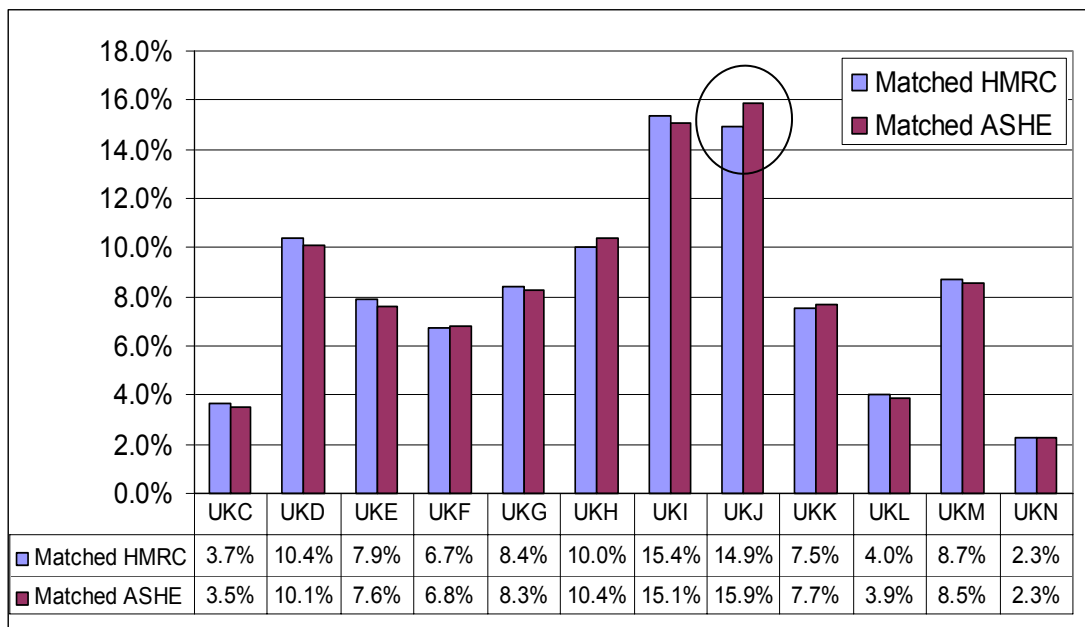

### **4 Developments and Conclusions**

#### **4.1 NUTS1**

The evidence above indicates that the majority of addresses on the HMRC dataset are accurate. Where differences do exist the suspicion is that the HMRC dataset is out of date. It is possible that the differences cancel each other out because the net migration between regions is zero or negligible. Where this is the case there is no need to make an adjustment - as the effect on total CoE by region is insignificant. However, if there is net migration into or out of a region an adjustment would improve the data.

The main concern for the regional accounts is the proportion of total earnings assigned to each region. This is because the HMRC data is used to apportion the national total earning to regions. Therefore, it does not matter what the level of pay is in a region as long as it is getting the correct proportion of the UK total pay. To investigate this, a comparison, for the matched data, was carried out on the regional distribution of earnings as it is, and what it would be if all the HMRC addresses are correct - according to the ASHE. The resulting distribution for the matched data is shown in Figure 4.1, although similar, there are some differences. Using the ASHE addresses one percentage point more of the total earnings would go to the South East (UKJ) than it would using the HMRC address information.

**Figure 4.1: Percentage of HMRC matched data total pay assigned to each NUTS1 region, comparing HMRC addresses and ASHE addresses.**

Chi-squared tests<sup>2</sup> were used to investigate whether the distribution of the ASHE and HMRC addresses for the matched data is significantly different (Appendix D). The

<sup>2</sup> A test derived from the chi-squared distribution (a continuous single parameter distribution) to compare goodness of fit of frequency distributions.

## ANNEX C

test, when applied to all regions, showed the distributions to be significantly different. However, when the South East was removed the difference between the two distributions was not significant. This suggests the difference between the two distributions is mainly due to the South East. The HMRC data should be adjusted upwards in the South East to make it closer to the ASHE - which is believed to be more up-to-date.

In order to adjust the share for the South East upwards the share for at least one other region must be adjusted downwards. The percentage of matched cases where the addresses were the same on both datasets was lowest in London (87 per cent) and below the national average (92.5 per cent) in the South East and East of England. This suggests any inaccuracies in regions are likely to be highest in these three regions. Migration statistics support movement from London into the other two regions, as there is a net migration out of London to both the South East (48,000 people) and the East of England (39,000 people) in the year to March 2003 (Appendix A).

This suggests people are moving out of London and into the South East, so any delay in the address information on the HMRC dataset would over estimate the people assigned to London and under estimate the number of people in the South East. This is consistent with results seen in the matched data. Therefore, London should be adjusted downwards to compensate for the upward adjustment in the South East.

### **4.1.1 Adjustment**

The first stage of the adjustment was to decide how many people should be moved, and then the money assigned to each person was determined. This was done for the matched data, and then for the whole dataset (matched and unmatched records) was considered (see Appendix E for more detail).

For the first stage nine options were considered - eight adjustments and no correction. Each adjustment is determined by the difference between the number of people assigned to a region on the ASHE and the number of people assigned to the same region on the HMRC.

$$\begin{aligned} & (\text{No. of people in UKX on HMRC}) - (\text{No. of people in UKX on ASHE}) \\ & = \text{Difference in UKX} = D_x \end{aligned}$$

(Where UKX = any region)

The adjustments considered are summarised below:

- 1) One-third of  $D_I$  stays in London (UKI) the other two-thirds are split between the East of England (UKH) and the South East (UKJ) in proportion to  $D_H$  and  $D_J$ .
- 2) All of  $D_I$  is taken off London and reassigned to the East of England and the South East in proportion to  $D_H$  and  $D_J$ .
- 3)  $D_H$ ,  $D_I$  &  $D_J$  are summed, two-thirds of this comes off London and is added to the East of England and the South East in proportion to  $D_H$  and  $D_J$ .

## ANNEX C

- 4) Half of  $D_I$  is taken off London and assigned to the South East.
- 5) All of  $D_I$  is taken off London and added to the South East.
- 6) The sum of  $D_I$  and  $D_J$  is added to London and taken off the South East ( $D_I + D_J < 0$ ).
- 7) 90 per cent of  $D_I$  is taken off London and added to the South East.
- 8) The value of the mid-point between  $D_I$  and  $D_J$  is taken off London and added to the South East.

A chi-squared test was carried out on each of the options (see Appendix E), the results of which were then compared to help choose between them. Option 8 is the only option that showed the two distributions as not statistically significantly different at the 95 per cent confidence level for all three years of data available (however the 2000-01 data should be given less weight as it is experimental). Option 8 has the lowest chi-squared value, for most years, this is similar to having the lowest value for the sum of the squared difference. Option 8 works by reducing the sum of square differences as much they can be by only adjusting these two regions. This means the adjustment gives the ASHE and HMRC datasets the most similar distributions in the majority of cases.

Following consultation with methodology directorate within ONS and advice from Southampton University a further test was carried out on the distribution of records. The Stuart-Maxwell test was deemed more appropriate for the purposes of this exercise to show whether records on the HMRC were similar to what they should be according to the ASHE. The results of this led to similar conclusions to those from the chi-square test. The test showed that Option 8 or Option 3 would be equally acceptable for the adjustment to the data (see appendix F for more detail). Therefore, ONS Regional Accounts recommend the use of Option 8.

All the adjustments considered are shown in detail in Appendix E - this section describes only Option 8 which is the option recommended by ONS Regional Accounts. The values from the HMRC 2002-03 matched with ASHE 2003 are used to illustrate this adjustment (shown in figure 4.2).

Figure 4.2: Number of people by region prior to adjustments (only includes records with an address specified on both datasets).

	UKC	UKD	UKE	UKF	UKG	UKH	UKI	UKJ	UKK	UKL	UKM	UKN	TOTAL
ASHE Original	6616	17123	13478	11673	14194	14973	16947	21725	13242	7048	14547	4153	155719
HMRC Original	6799	17316	13698	11589	14258	14669	17282	21071	12978	7156	14670	4233	155719
Difference = $D_x$	183	193	220	-84	64	-304	335	-654	-264	108	123	80	0

Only London (UKI) and the South East (UKJ) are affected by the recommended adjustment. Both regions are adjusted by the mid point of  $D_I$  and  $D_J$  (the difference in number of people assigned to UKI and UKJ on the HMRC and ASHE):

ANNEX C

$$IncrI = \frac{D_J - D_I}{2}$$

$$IncrJ = -\left(\frac{D_J - D_I}{2}\right)$$

Where IncrI is the amount UKI should be adjusted by and IncrJ is the amount UKJ should be adjusted by.

This is the best method to use as it will work consistently for the data from previous years as well as working in future. This is because the contribution to the sum of squared differences by these regions ( $D_I^2 + D_J^2$ ) is minimised by this method. For example the HMRC 2002-03 matched with ASHE 2003:

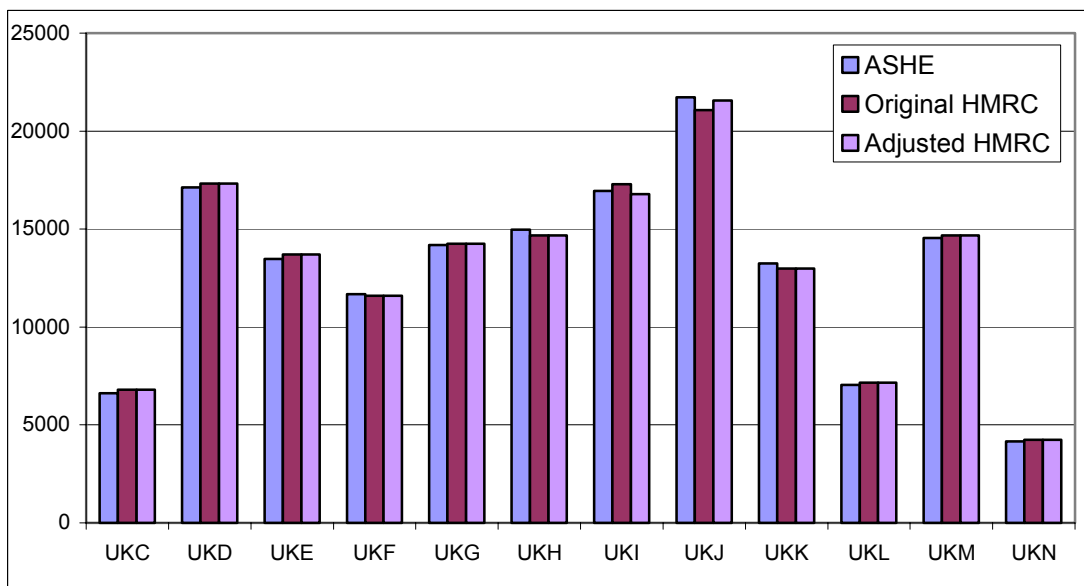

$$IncrI = \frac{-654 - 335}{2} = -494.5$$

The increment for UKJ is the positive of this value, so 495 people would be taken from London (UKI) and added to the South East (UKJ). For the HMRC 2001-02 data matched with the ASHE 2002 data:

$$IncrI = \frac{-620 + 8}{2} = -306$$

Figure 4.3 shows the effect of this adjustment on the number of individual in each region for the HMRC 2002-03 data matched with the ASHE 2003:

Figure 4.3: Changes in number of individuals in each region for the matched data due to the adjustment for the HMRC 2002-03 vs. ASHE 2003.

## ANNEX C

Once the movement of people had been decided, there were three options for the money each individual being moved should be assigned in order to arrive at a total earnings adjustment value for the matched data.

The three possibilities considered for the amount of money each individual should be assigned were: the average pay for the donor region (UKI – London), the average pay for the receiving region (UKJ – South East), or the average pay for those people who are assigned to London on the HMRC and the South East on the ASHE. The final option seems the most instinctive as these are the people the adjustment is trying to capture. However, the number of people making up this average is relatively small, as the number of people assigned to London on the HMRC and the South East on the ASHE is small. This means there is more chance of variability from year to year, with one or two individuals having a large effect on the average. The third option is also less easy to use as it can not be extended to the unmatched data in the same way the other two options could. This is because these people cannot be separated from other people in London on the HMRC for the unmatched data. Therefore, this option was not useable. Of the other two options, using the mean earnings for London seems the most sensible. This is because the people theoretically being moved have contributed to the mean pay in the London region as this is where they appear on the HMRC database. Therefore, this is the recommended option with the effects of this adjustment shown in Figure 4.4.

For the matched data in 2002-03 this means that 0.4 per cent of the UK total earnings are moved from London to the South East. This is 2.9 per cent of the total pay for London. The total pay is the same as the mean pay multiplied by the number of people in the region so moving 2.9 per cent of people also moves 2.9 per cent of total earnings for London by this method. Once you know the proportion of people being moved from London you also know the proportion of money to transfer. Figure 4.4 shows matched HMRC (2002-03) data before and after the adjustment compared with the HMRC data with correct addresses according to the ASHE.

## ANNEX C

Figure 4.4: Proportion of UK pay by region for the matched adjusted HMRC (2002-03) data compared with the ASHE (2003) and unadjusted HMRC (2002-03)

There is no evidence to suggest that the quality of address information on the unmatched dataset is worse than the address information on the matched data (Appendix B).

Therefore, the adjustment carried out on the matched data can also be applied to the unmatched data. Two ways of doing this were considered:

- a) The proportion of total money to be moved, as found from the matched dataset, applied to the whole dataset, or,
- b) The percentage of people moved from London on the matched dataset are also removed from London on the unmatched dataset, with each record assigned the corresponding London mean pay (matched or unmatched respectively).

The second option is preferred as it takes into account the differences in regional distribution (and mean pay) on the unmatched dataset. It also simplifies the adjustment process because it reduces the number of steps i.e. the only information needed is the percentage of people being moved from London on the matched data. This percentage is then taken off the total pay for London (i.e. matched and unmatched records combined) and added to the South East (see Appendix E for more detail).

Once the percentage has been calculated the final adjustment can be applied straight to the aggregated values provided by HMRC. This adjustment is ONS Regional Accounts preferred adjustment.

## ANNEX C

### 4.2. NUTS2 and 3

Chi-squared tests were also carried out on the number of individuals assigned to each region on the HMRC and ASHE datasets at the NUTS 2 and 3 levels (see Appendix H). At NUTS2 this showed the distribution to be significantly different if all regions were considered but not significantly different if those regions contained within the South East NUTS1 region were removed. At NUTS 3 the chi-squared test showed no significant difference. This suggested that the only adjustments needed at NUTS2 or NUTS3 were within the regions being adjusted at the higher levels of geography.

Two possible ways to calculate this adjustment were considered. The first option is to split the NUTS1 adjustment between regions in proportion to the difference in number of people assigned to each region by the ASHE and the HMRC at the NUTS2 and 3 levels. For example, if there is a bigger difference between the ASHE and the HMRC in Inner London (UKI1) than Outer London (UKI2) more of the money would be taken from Inner London than Outer London.

There are two concerns with this method: because the differences are smaller there is more volatility in the results and there is also net migration from London to the South East; at a lower level comparison might suggest net migration into a sub-region giving inconsistent results. For example, if the HMRC assigns more people to a NUTS 2 region of the South East than the ASHE, this is the opposite situation to the South East as a whole. Not adjusting regions where this occurs will solve this problem, but leave volatility in the results.

The second option is to use the number of people in employment in each region to apportion out the money at NUTS2 and 3 levels. This is better than the last option in terms of consistency over time. However, this implies that migration from London to the South East affects all regions equally. In practice it would be expected that more people migrate to regions closer to London (often within commuting distance of London), which this method would not allow for. Information about the net migration should help to resolve this issue.

ONS publish figures about migration, at the lower levels of geography, based on former health authority patients. However, these figures only give information about the net migration for a region not the migration between regions - as seen at NUTS1.

### 5. Recommendations

Based on the results of the matching exercise, ONS Regional Accounts recommend that the HM Revenue and Customs data should be used in the compilation of NUTS1 estimates of GVA and NUTS2-3 estimates of GDHI following a quality adjustment.

The HMRC data should be adjusted by increasing the earnings share of the South East and lowering the earnings share of London in the method specified in this paper.

The adjustments at NUTS2 and 3 should only be applied within the regions being adjusted at NUTS1.

## ANNEX C

The project should be repeated annually to create a series that gives a consistent adjustment over time. The adjustment currently recommended should be reviewed to ensure it is still the best method and takes into account any additional information. If a consistent adjustment can be found and applied without consulting the individual records, the matching could be repeated on a less regular basis.

## Appendix A Background Information

### Grossed ASHE vs. HMRC

Figure A.1: Total annual pay from individual HMRC records compared with the grossed ASHE - 2002-03 HMRC 2003 Grossed ASHE residence.

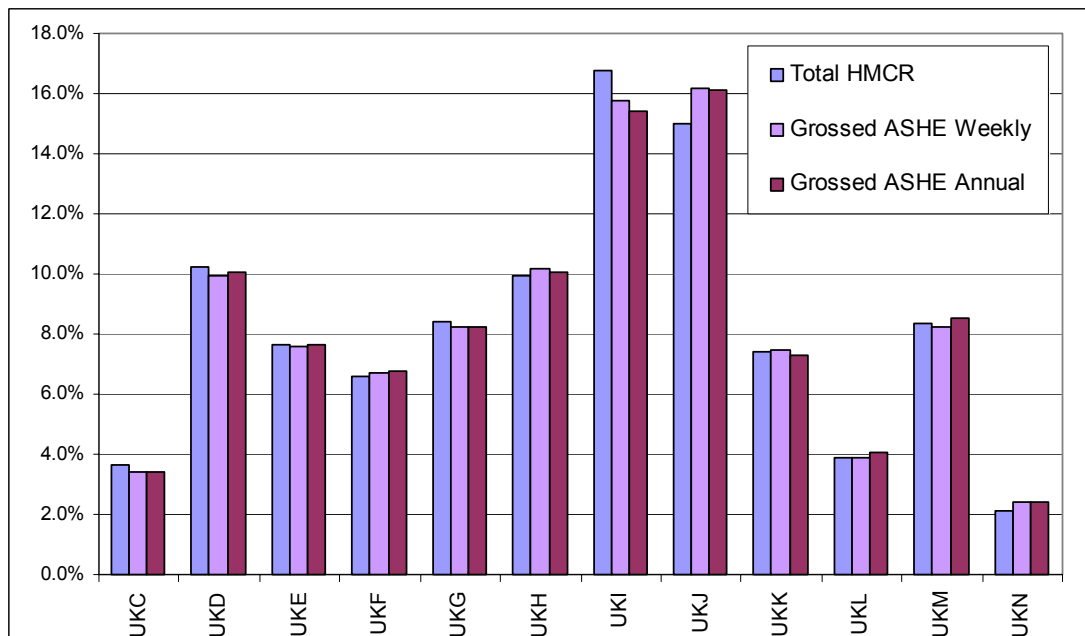

Figure A.2: Total annual pay from individual HMRC records compared with the grossed ASHE - 2001-02 HMRC 2002 Grossed ASHE residence.

Figures A.1 and A.2 show very little difference between the percentage of total pay assigned to a region on the grossed ASHE and the HMRC individual records. The only two regions that show much difference are UKI and UKJ. The differences can be

seen in Figure A.3 and A.4. The results for both years are similar, only UKI and UKJ have a difference of over 0.5 per cent of total pay.

**Figure A.3: Difference between HMRC 2002-03 and Grossed ASHE 2003**

**Figure A.4: Difference between HMRC 2001-02 and Grossed ASHE 2002**

**Number of people in employment Labour Force Survey vs. HMRC**

Figures A.5 and A.6 below show the percentage of people in employment in Great Britain assigned to each region as given by the Labour Force Survey<sup>1</sup> (LFS) and HMRC. The LFS can be compared with the HMRC as they both give number of people in employment by place of residence. Any delay in address information that

<sup>1</sup> LFS is an ONS survey collected four times a year which includes employment information. ONS recommend a four quarters average is used for annual estimates of people in employment.

might appear on the HMRC dataset should not occur on the LFS as the results are collected by an interviewer who goes to the house of the individual being surveyed. Therefore, although we can gain no additional information about earnings, we should be able to see if the proportion of people by region is sensible. A comparison of these two datasets also gives an indication about whether the HMRC 1 per cent sample is representative of the whole UK. The LFS information is taken from Nomis<sup>2</sup> which does not hold information about Northern Ireland so the comparison below is only for Great Britain only.

Figure A.5: Percentage of people in employment be region on the HMRC (2001-02) and the LFS (2001-02)

Figure A.6: Percentage of people in employment be region on the HMRC (2002-03) and the LFS (2002-03)

<sup>2</sup>Nomis is a web-based database of labour market statistics run by the University of Durham on behalf of the Office for National Statistics <http://www.nomisweb.co.uk>

Figure A.7: Percentage of people in employment by region on HMRC dataset and as given by the LFS

		2001-02		2002-03	
		HMRC	LFS	HMRC	LFS
North East	UKC	4.1 %	4.3 %	4.1 %	4.3 %
North West	UKD	11.4 %	11.5 %	11.5 %	11.5 %
Yorkshire and The Humber	UKE	8.6 %	8.7 %	8.7 %	8.6 %
East Midlands	UKF	7.5 %	7.3 %	7.6 %	7.4 %
West Midlands	UKG	9.2 %	9.2 %	9.2 %	9.1 %
Eastern	UKH	9.9 %	9.6 %	9.7 %	9.6 %
London	UKI	12.5 %	13.0 %	12.3 %	13.0 %
South East	UKJ	14.9 %	14.2 %	14.6 %	14.1 %
South West	UKK	8.6 %	8.5 %	8.7 %	8.4 %
Wales	UKL	4.5 %	4.6 %	4.7 %	4.7 %
Scotland	UKM	8.9 %	9.1 %	9.0 %	9.1 %

This shows that the only NUTS1 regions where the difference is greater than 0.5 per cent, in one or both years, are London and the South East. This is further evidence to indicate the adjustment shown in Section 4 is necessary and that no other areas need adjusting. The adjustment specified should, in part, eliminate the differences between sources in figure A.7.

### **Migration statistics**

Below are the internal migration statistics based on patients re-registering with NHS doctors in other parts of the United Kingdom; these show there is a net migration out of London and into other regions. If concerns initially raised about the HMRC addresses not being up to date are correct, it would be expected that more people are assigned to London than there are in reality and less people in the regions they migrate too. The table below shows that a lot of people in London are moving to the South East (UKJ) and the East of England (UKH). A negative number in the 'net change' column means people are moving out of London into the region specified in the row.

#### Migration into and out of London for the year to March 2003

People (thousands)	Destination = London	Origin = London	Net change
North East (UKC)	4.4	5.1	-0.7
North West (UKD)	12.1	13.7	-1.6
Yorkshire and The Humber (UKE)	9.6	11.4	-1.8
East Midlands (UKF)	10	15	-5.0
West Midlands (UKG)	11.3	13.2	-1.9
<b>East (UKH)</b>	<b>27.9</b>	<b>66.8</b>	<b>-38.9</b>
London (UKI)	-	-	-
<b>South East (UKJ)</b>	<b>50.4</b>	<b>98.2</b>	<b>-47.8</b>
South West (UKK)	14.3	25.1	-10.8
Wales (UKL)	4.5	6.2	-1.7
Scotland (UKM)	6.9	8.3	-1.4
Northern Ireland (UKN)	1.2	1.7	-0.5

## Migration into and out of London for the year to March 2002

	Destination = London	Origin = London	Net change
North East (UKC)	4.9	4.4	0.5
North West (UKD)	12.7	12.8	-0.1
Yorkshire and The Humber (UKE)	10.2	10.3	-0.1
East Midlands (UKF)	10.4	14.4	-4.0
West Midlands (UKG)	11.6	12.5	-0.9
<b>East (UKH)</b>	<b>28.6</b>	<b>63.9</b>	<b>-35.3</b>
London (UKI)	-	-	-
<b>South East (UKJ)</b>	<b>51.4</b>	<b>92.3</b>	<b>-40.9</b>
South West (UKK)	15.4	23.5	-8.1
Wales (UKL)	5	5.8	-0.8
Scotland (UKM)	7.4	7.6	-0.2
Northern Ireland (UKN)	1.4	2.1	-0.7

## AGE HMRC vs. Census

For additional information the age of people in employment, as given by the census, was compared with the age of people on the HMRC. This was done to make sure that the information HMRC have is consistent with the UK picture and that the HMRC records are a representative random sample. The Census was collected on 29 April 2001 this is inside the 2001-02 tax year, the preceding year was also compared (i.e. 2000-01), however, there was very little variation between years, so the 2001-02 data is shown below.

Figure A.8: Percentage of people within the specified age band on the HMRC (2001-02) compared with the 2001 Census

Figure A.8 shows that the age distribution of the HMRC PAYE dataset is broadly similar to the age distribution from the Census and is further evidence that the data is an accurate representation of the UK as a whole.

## **Appendix B Information about the Unmatched data**

### **Comparison of Characteristics on the matched and unmatched datasets**

The matched and unmatched datasets exhibit different characteristics. These differences give an indication about the people who are on the unmatched dataset. The areas shown below do not necessarily add any information about the accuracy of the address information on the HMRC, but are useful background information to help understand the data being used.

#### **Age**

**Figure B.1: Percentage of HMRC 2002-03 individuals matched and unmatched by age.**

From Figure B.1 it is clear the unmatched individuals have a different age distribution with higher proportions of people in the younger and older age groups. For example 30 per cent of people on the unmatched dataset are under 30, for the matched data it is 18 per cent. On the matched data 5 per cent of individuals are aged over 60 compared with 15 per cent on the unmatched data. Anybody who is retired and receives an occupational pension will not appear in the dataset – as with the ASHE. However, if a person does not receive an occupational pension and is in some kind of employment they will have a record on the HMRC dataset.

Some of the individuals without a record on the ASHE may only work part of the year - so were not in employment when the ASHE was collected. This is most likely to occur in the younger and older age groups. For example, a person temping for only part of the year, or someone who retires during the year. These people would also, on average, have lower pay as they are not getting a full annual salary. This is consistent with Figure B.3 showing the mean pay is lower on the unmatched dataset.

## Pay

Figure B.2: Percentage of total pay by region matched vs. unmatched HMRC data

Figure B.2 shows the proportion of total pay assigned to each region is similar on the matched and unmatched datasets for all regions except London (UKI). This could be, either because London has a higher mean pay in comparison to other regions, or a higher proportion of people assigned to London. Figure B.3 shows it is not the first of these, as the difference in pay for the matched data in London is similar to the difference for the unmatched pay. Figure B.6 shows it is because a higher proportion of people are assigned to London on the unmatched dataset.

Figure B.3: Mean pay by region for the matched and unmatched HMRC records (2002-03).

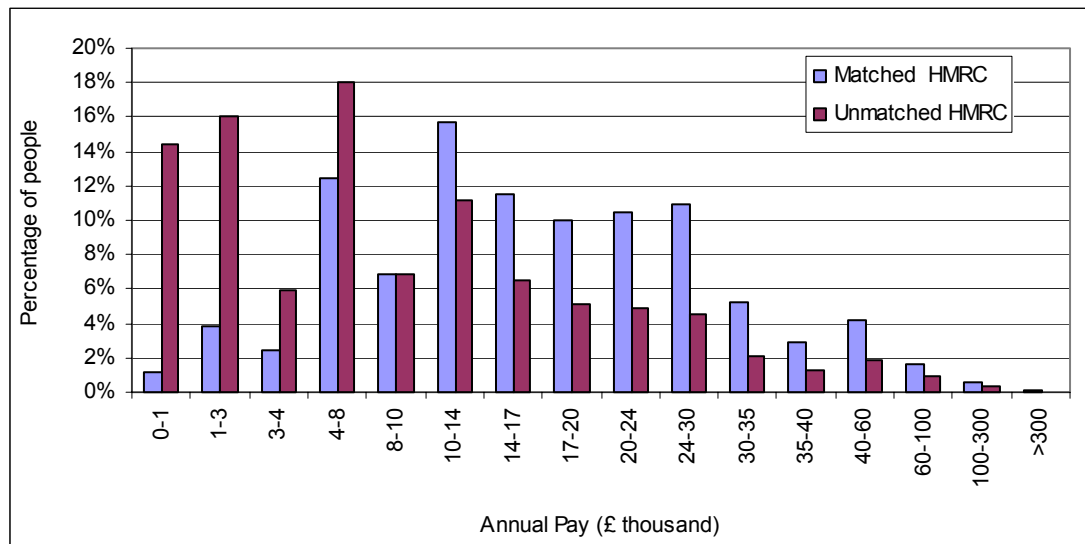

Figure B.3 shows, on average, people on the unmatched dataset have a lower pay than people on the matched dataset. This could be for the reasons specified in relation to age above, and because the ASHE does not pick up seasonal workers - who generally have lower pay. This does not indicate the quality of the addresses on the unmatched data as any worse, but it does show that the contribution of these people to total CoE

is smaller than that of the matched data (the number of people on the unmatched dataset is also smaller). This means any inaccuracies in the unmatched data will have less of an impact on the total earnings by region. The unmatched individuals (46 per cent of records from the HMRC 2002-03 dataset) make up only 32 per cent of total earnings.

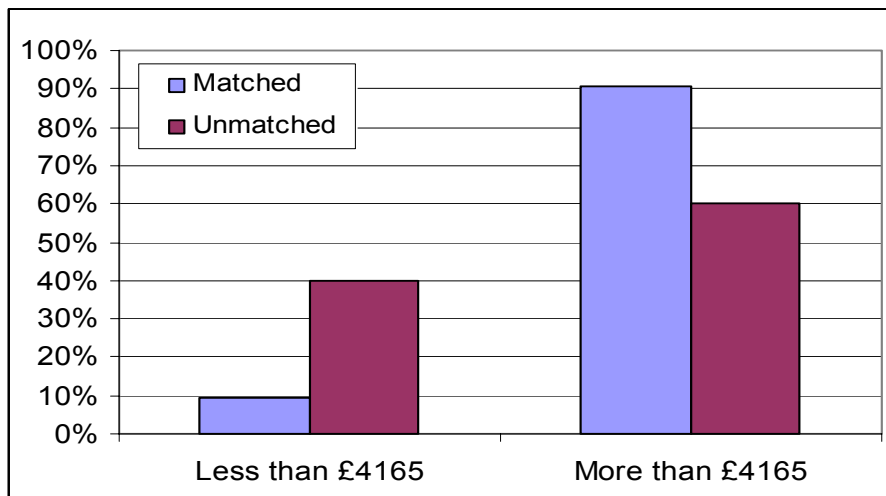

Figure B.4: Percentage of people in each annual pay category for the matched vs. unmatched HMRC.

This shows that there are more people with a lower annual pay in the unmatched dataset than in the matched dataset (this is what you would expect given the mean pay is lower for the unmatched records). One reason for this could be because employers are not legally obliged to fill in forms for employee's who earn below the tax threshold. Some large companies (who have electronic systems designed for submitting forms) will submit a form for these low paid employees meaning some appear on the dataset. These people may not then be included in the ASHE returns.

Figure B.5 compares the proportion of people earning below the tax threshold (£4165 for 2002-03) on the matched and unmatched datasets. It shows there are a much higher proportion of people below the tax threshold on the unmatched dataset than the matched dataset.

Figure B.5: Percentage of people below and above the tax threshold in the matched and unmatched HMRC data.

### Regional distribution

Figure B.6: Percentage of people assigned to each region from the matched vs. unmatched HMRC data

This explains why the percentage of total pay by region (Figure B.2) is so much higher for the unmatched data. There are a much higher proportion of people assigned to London (UKI) from the unmatched records than the matched records.

## SIC code

Figure B.7: Percentage of people on the HMRC dataset assigned to SIC codes (31 industry)

The only regions where there appear to be differences between the matched and unmatched distributions are H, K, M, and N (H = Hotels & restaurants, K = Real estate, renting & business activities, M = Education and N = Health & social work). These industries were separated for the simulations as described in section 2.2 and Appendix C.

### Quality of the unmatched data

On the HMRC dataset in 2002-03 only 27.5 per cent of records do not ever match an equivalent record on the ASHE dataset (2001-02 25.7 per cent, 2000-01 27.3 per cent) compared with 44 per cent that don't have an equivalent record on the ASHE 2003 (see figure 3.2). The information from records that are unmatched in one year and matched in another can give an indication of the quality of the unmatched dataset.

The initial reason for carrying out the matching exercise was a concern that the addresses on the HMRC dataset are out of date. It is clear from the results for the matched data that the quality of address information for these records is high. The unmatched records must be investigated further to increase the confidence in quality of address information on these records. Using the information about records that are matched in some years and unmatched in others we can investigate the quality of address information on the unmatched data. This is easiest for HMRC records that are matched in 2002-03 and unmatched in a preceding year. It is possible to see if there is change of address between the year a record is unmatched and the following year when it is matched again. If there are not many changes of address between years it is unlikely that the address information is any less accurate than the information for the matched data. This should reduce concerns that people linked to the unmatched records are more likely to have changed address because they have moved jobs. It is

possible to see how many of the address are correct for the year when records are matched. If these individuals have correct addresses - according to the ASHE – for the year they are matched then it likely that the addresses were correct in the year when they were unmatched as well. However, if there are a lot of changed addresses it is not possible to infer anything about the data in the year it was unmatched.

The best data to use to find out about the quality of address information on the unmatched records is the set of records that were unmatched in 2001-02 and matched in 2002-03. First, the number of records that have the same address on the HMRC between years was considered, and then the 2002-03 HMRC addresses were compared with the ASHE 2003 addresses for this set of records. Of these individuals 98.7 per cent had the same address on the 2001-02 dataset as the 2002-03 dataset, this is similar in all regions:

UKC	UKD	UKE	UKF	UKG	UKH	UKI	UKJ	UKK	UKL	UKM	UKN
99.0%	98.4%	98.3%	98.3%	98.3%	98.7%	98.4%	98.3%	97.6%	98.1%	98.9%	97.4%

According to the ASHE 2003 dataset 91 per cent of these records have the correct address information on the HMRC in 2002-03. This varies by region, as with the total matched dataset:

UKC	UKD	UKE	UKF	UKG	UKH	UKI	UKJ	UKK	UKL	UKM	UKN
90.4%	92.1%	92.5%	90.5%	92.4%	89.0%	88.9%	90.0%	89.5%	90.5%	94.9%	92.9%

The evidence in these tables suggests that the quality of the address information for the unmatched dataset is high with over 90 per cent of addresses correct at the NUTS1 level. Therefore, any conclusions about the matched data are equally valid for the unmatched data.

## **Appendix C Simulating the unmatched data**

A simulation was used to try and learn more about the accuracy of the address information on the unmatched data and, therefore, the whole dataset. This method had been used in the matching exercise in 2004 but there were still some concerns with the method, the results it produced and whether it was in fact an accurate representation of the unmatched data.

A stratified sample was created from the matched dataset with the same characteristics as the unmatched dataset. The groups initially used in the estimate for the percentage of matched addresses in Section 2.2 were not believed to be enough to give an accurate representation of all regions. The mean pay by region created by the simulated sample was not the same as the mean pay by region of the unmatched data for this regional breakdown. Therefore, the unmatched data was split into the following annual pay and region categories to allow for the different distributions as shown in figure B.4.

Annual pay Categories:

£0-£1,000	£1,000-£3,000	£3,000-£4,000	£4,000-£8,000
£8,000-£10,000	£10,000-£14,000	£14,000-£17,000	£17,000-£20,000
£20,000-£24,000	£24,000-£30,000	£30,000-£35,000	£35,000-£40,000
£40,000-£60,000	£60,000-£100,000	£100,000-£300,000	more than £300,000

Regional Categories:

London (UKI)	South East (UKJ)	East of England (UKH)	Other
--------------	------------------	-----------------------	-------

This gives  $16 \times 4 = 64$  strata. The lowest pay category was excluded because more records were assigned to this category for the sample of 20,000 than there were in the whole matched dataset. It was believed that these records would not contribute very much to total earnings so the effect of removing them was negligible. The highest earners (- those earning more than £300,000 a year -) were also excluded. This was done in order to make sure the results for total earnings by region were not effected by a small number of unrepresentative individuals. The percentage of the sample that should be assigned to each of the remaining 56 categories was found from the unmatched data. The records were then randomly assigned from the appropriate strata in the matched data to produce a random stratified sample. This sampling was repeated twenty times in each case to make sure the results were consistent and to allow a paired t-test<sup>3</sup> to be carried out on the means. For the t-test to be valid the estimates found from the sampling must be normally distributed. This was a further reason not to use the highest pay category as it would have meant the results were less likely to be normally distributed.

Once the sample simulating the unmatched records had been chosen a total pay for the sample was calculated. The total pay for the unmatched HMRC data was split up by

<sup>3</sup> Given two Paired sets  $X_i$  and  $Y_i$  of  $n$  measured values the paired t-test determines whether they differ from each other in a significant way under the assumptions that the paired differences are independent and identically normally distributed.

region according to the proportion of pay assigned to each region in the simulated dataset. The estimated unmatched pay by region was then added to the pay by region for the matched data to give total pay by region. The results for the 2002-03 and 2001-02 datasets are shown below.

Figure C.1: Percentage of total pay assigned to regions from the 2002-03 HMRC data (matched data combined with simulated unmatched data).

Figure C.2: Percentage of total pay assigned to regions from the 2001-02 HMRC data (matched data combined with simulated unmatched data).

A number of possible adjustments were considered as a result of the simulation (detailed below). However, it was felt the simulation could not be a basis for the adjustment proposals as there were still doubts about the validity of the assumptions needed to carry out the simulation and t-test. Another concern with this method is a number of regions being grouped together (“other”). The same adjustment would have to be imposed on all regions contained within “other”, which might lead to one region becoming less accurate. There is not enough matched data to split the dataset into

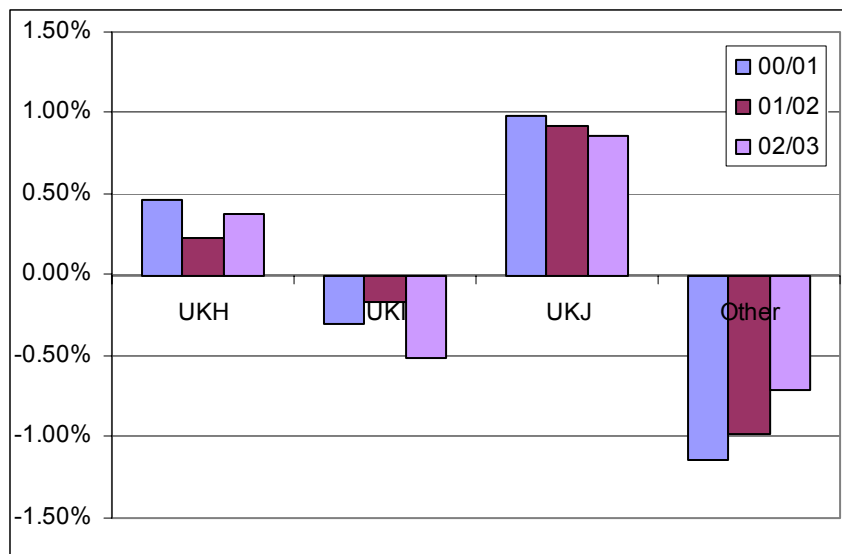

individual regions, so this was the best approximation considering the pay distribution within each region.

The adjustment Options considered as a result of this simulation were discarded, but are described below for completeness. The adjustments are based on the four regions used in the simulation exercise, UKH (East of England), UKI (London), UKJ (South East) and all other regions combined. The adjustment is carried out on the total pay assigned to a region from the HMRC matched and unmatched actual data, with the size of the adjustment based on the stratified datasets.

For each year and region the difference in mean percentage of total earnings ( $X_{diff}$ ) is shown below;

	UKH	UKI	UKJ	Other
00/01	0.46 %	-0.30 %	0.99 %	-1.15 %
01/02	0.23 %	-0.17 %	0.92 %	-0.98 %
02/03	0.37 %	-0.52 %	0.86 %	-0.71 %
Average for 02/03 and 01/02	0.30 %	-0.34 %	0.89 %	-0.85 %

Figure C.3: Differences between the data with HMRC address and correct address as stated by ASHE from the simulation exercise (including matched data).

$$X_{diff} = (\text{mean percentage of total pay assigned to UKX by ASHE address}) - (\text{mean percentage of total pay assigned to UKX by HMRC address})$$

### Option I

The first option was to take the difference in mean percentage of total pay by region (as shown in figure C.3) for the HMRC and what it would be if all HMRC addresses are correct according to the simulation.

The East of England (UKH) and South East (UKJ) would be incremented up, as the simulation showed these two regions are assigned less money when the HMRC addresses are used than they are if the ‘correct’ addresses are used. The amount these two regions are increased by is taken from London (UKI) and all other regions (other) according to the proportion of money originally assigned to each region.

XIncr = amount UKX should be adjusted by.

(Where UKX = any region)

$$HIncr = Hdifff$$

$$JIncr = Jdifff$$

$$IIncr = -(HIncr + JIncr) \times \left( \frac{Idiff}{Idiff + OTHdiff} \right)$$

$$OTHIncr = -(HIncr + JIncr) \times \left( \frac{OTHdiff}{Idiff + OTHdiff} \right)$$

The amount to be assigned is decided as shown in the equations above using the average differences for 2002-03 and 2001-02. The ‘OTHincr’ (-the amount all other regions will be reduced by -) is assigned in proportion to the amount of money in each region.

Figure C.4: Comparison of the adjusted data with the original data and the mean total pay assigned by ASHE addresses from the stratified samples (2002-03 HMRC).

Figure C.4 shows that for UKF and UKK the new HMRC data is lower than the old data. This makes these regions less accurate than they were originally as the HMRC is already lower than it should be if all the addresses are correct according to the ASHE

simulated data. This could happen in other regions, in other years and makes the data for these regions less accurate than it was originally.

### Option II

For this option, it is not the total difference that is used but an increment that will make the difference in all regions not significant. This is done using the upper and lower confidence limits for the data with the ‘correct’ (ASHE) address from the twenty stratified samples. The change needed to make the difference in UKJ not significant is found;  $J_{Incr} = (\text{Lower confidence Limit} - \text{UKJ HMRC actual})$ . The same thing is then found for UKH and the change to UKI and the other regions is found using the following equation;

$$I_{Incr} = -(H_{Incr} + J_{Incr}) \times \left( \frac{I_{diff}}{I_{diff} + OTH_{diff}} \right)$$

$$OTH_{Incr} = -(H_{Incr} + J_{Incr}) \times \left( \frac{OTH_{diff}}{I_{diff} + OTH_{diff}} \right)$$

As with Option I,  $OTH_{Incr}$  is pro-rated to the nine regions included in “other”.

	<b>2002-03</b>	<b>2001-02</b>	<b>2000-01</b>	<b>Increment to use</b>
<b>UKJ increment</b>	0.69 per cent	0.75 per cent	0.76 per cent	0.8 per cent
<b>UKH increment</b>	0.17 per cent	0.11 per cent	0.38 per cent	0.2 per cent
<b>I<sub>Incr</sub></b>	-0.42 per cent	-0.15 per cent	-0.21 per cent	-0.3 per cent
<b>OTH<sub>Incr</sub></b>	-0.58 per cent	-0.85 per cent	-0.79 per cent	-0.7 per cent

The increment used for UKJ and UKH, is the biggest of the increments for 2002-03 and 2001-02 as this will mean the difference is not significant in any year (the 2000-01 data does not need to be included as it was experimental data).

Figure C.5: Difference between the adjusted HMRC data and data found from the stratification with the ASHE addresses.

Figure C.5 shows that the differences are not as much as they were prior to the adjustment (see figure C.3 - note the scale is not the same). Therefore, the new data is more accurate if the stratified samples are accurate and normally distributed.

### Conclusion

Both these options have two problems associated with them. The first being the accuracy of the stratified sample, which is relied on in order to find the differences between the HMRC as it is and as it should be. The other problem that arises concerns the “other” regions. The adjustment carried out to all of them is the same (in proportion to their size), which means the HMRC data may be reduced even though a region is already lower than it is judged it should be. The East Midlands (UKF) in Option I shows the effect of this. The difference might originally be very small but with the increased difference it would become less accurate. These options also raise concerns as they imply all regions are inaccurate, while all other data suggests that it is only London (UKI) and the South East (UKJ) and possibly the East of England (UKH) that contain possible inaccuracies.

Another concern with this method is highly paid individuals. People earning over £300,000 will contribute more to a region, and therefore, in a sample of 20,000, one individual could create unrealistic results. However, these people do exist and any method must take account of this contribution to total pay in some way.

For these reasons ONS Regional Accounts believe the adjustment options described in this Appendix and any other option involving this simulation should not be used.

## **Appendix D NUTS1 Chi-Squared Tests and Percentage of Matched Addresses**

Chi-squared tests were carried out to compare the distribution of the ASHE and HMRC individuals by region for the matched data. The first test was carried out on all regions using all records where the address is known. Then the South East (UKJ) was excluded and finally London (UKI) and the South East were excluded. The test without UKJ was carried out as this region appeared to have the biggest difference in terms of money and people, and appeared to be the biggest contributor to a difference in distributions. Without UKJ, the chi-squared test shows the distribution of people among regions is not statistically significantly different on the two datasets. (i.e. the value of chi square from the table is higher than the value found from the data when UKJ is excluded).

### Chi square test results from the HMRC 2002-03 matched with ASHE 2003 data:

Chi-squared (11 d.f.) = 26.9572  
 Stats Table Chi-squared (11 d.f.) - 95 per cent level = 19.6751  
**Statistically Significantly Different.**

Chi-squared excluding UKJ - South East (10 d.f.) = 15.1104  
 Stats Table Chi-squared (10 d.f.) - 95 per cent level = 18.3070  
**Not Statistically Significantly Different.**

Chi-squared excluding UKJ (South East) & UKI (London) (9 d.f.) = 14.1376  
 Stats Table Chi-squared (9 d.f.) - 95 per cent level = 16.9190  
**Not Statistically Significantly Different.**

The results from the 2001-02 data are similar to those above with the chi square value calculated being smaller for all regions (21.96) but still significantly different at the 95 per cent significance level. When UKJ is removed the chi square test again shows the distribution is no longer statistically significantly different.

### Percentage of correct addresses by region

According to the ASHE 92.5 per cent of HMRC addresses are correct the NUTS1 level. The table below shows the percentage of correct addresses at NUTS1 by region for the 2002-03 HMRC data when matched with the ASHE 2003.

UKC	UKD	UKE	UKF	UKG	UKH	UKI	UKJ	UKK	UKL	UKM	UKN
93.7	93.8	92.8	92.2	93.5	91.8	86.9	91.4	93.0	93.6	96.2	96.4
%	%	%	%	%	%	%	%	%	%	%	%

This shows that the level of “correct” addresses is worst in London (UKI) followed by the South East (UKJ) and then East of England (UKH). This implies that any inaccuracies in the data are more likely to be in these regions. This is further indication that adjustments to the data should be made in London and the South East, if adjustments are needed. The results are very similar for the 2000-01 and 2001-02 data.

Possible adjustment options are shown in Appendix E.

## Appendix E Possible NUTS1 Adjustments

Section 4 summarises eight adjustment options considered for the movement of people followed by three options considered for the earnings these individuals should be assigned. This Appendix gives details of all these options.

### Movement of People

The first three options include adjustments to UKH (East of England), UKI (London) and UKJ (South East); the other five options affect UKI and UKJ only. Individuals by regions on the ASHE 2003 and the HMRC 2002-03 are used to illustrate the options. Only records where there is an address specified on both datasets are used:

Figure E.1: Number of people by region prior to adjustments for ASHE 2003, HMRC 2002-03.

	UKC	UKD	UKE	UKF	UKG	UKH	UKI	UKJ	UKK	UKL	UKM	UKN	TOTAL
ASHE Original	6616	17123	13478	11673	14194	14973	16947	21725	13242	7048	14547	4153	155719
HMRC Original	6799	17316	13698	11589	14258	14669	17282	21071	12978	7156	14670	4233	155719
Difference	183	193	220	-84	64	-304	335	-654	-264	108	123	80	0

Figure E.2: Number of people assigned to each region on the ASHE (2003) and the HMRC (2002-03) prior to any adjustment.

$$\begin{aligned}
 & (\text{No. of people in UKX on HMRC}) - (\text{No. of people in UKX on ASHE}) \\
 & = \text{Difference in UKX} \\
 & = D_x
 \end{aligned}$$

$$\text{IncrX} = \text{Adjustment to be made to UKX}$$

(Where UKX = any region)

### Option 1

The difference between the number of people assigned to London on the HMRC and the ASHE (335 people in 2002-03) is divided up, one-third of the amount staying in London and the other two-thirds assigned to the East and the South East according to the differences found in these regions:

$$IncrI = -\left(\frac{2}{3}\right) \times D_I$$

$$IncrJ = \frac{D_J}{(D_J + D_H)} \times \left(\frac{2}{3}\right) \times D_I$$

$$IncrH = \frac{D_H}{(D_J + D_H)} \times \left(\frac{2}{3}\right) \times D_I$$

For example the 2002-03 HMRC and 2003 ASHE:

Region	HMRC - ASHE	Number of people	Proportion of people to each region	Proportion x people	Total
UKI	335	$-(2/3) \times 335 = -223$	1	-223	17059
UKH	-304	$(2/3) \times (335) = 223$	$304 / (304 + 654) = 0.317$	71	14740
UKJ	-654		$654 / (304 + 654) = 0.683$	152	21223

Figure E.3: Number of individual by region before and after adjustment Option 1 HMRC 2002-03 data matched with the ASHE 2003 data.

### Option 2

Again the size of the adjustment is decided by the difference between the number of people recorded as living in London on the ASHE and the HMRC ( $D_I$ ). In this option the number of people in London on the HMRC is brought down to the same level as the number of people in London on the ASHE. This amount (335 people in 2002-03)

is then split between the East of England (UKH) and South East (UKJ) in the same way the two-thirds was split in Option 1.

$$IncrI = -D_I$$

$$IncrJ = \frac{D_J}{D_J + D_H} \times D_I$$

$$IncrH = \frac{D_H}{D_J + D_H} \times D_I$$

Figure E.4: Number of individual by region before and after adjustment Option 2  
HMRC 2002-03 data matched with the ASHE 2003 data.

### Option 3

The aggregate difference in all three regions is used to decide how big the adjustments are. Two-thirds of the aggregate difference is taken off London and apportioned to the South East and the East of England. If

$$SumDiff = (D_H + D_I + D_J)$$

then the adjustment to each region is as follows,

$$IncrI = SumDiff - \frac{SumDiff}{3} = \left(\frac{2}{3}\right) \times SumDiff$$

$$IncrH = -(IncrI) \times \left(\frac{D_H}{(D_H + D_J)}\right)$$

$$IncrJ = -(IncrI) \times \left( \frac{D_J}{(D_H + D_J)} \right)$$

For example in 2003 (SumDiff = 335-304-654 = -623):

Region	HMRC - ASHE	Number of people	Proportion of people to each region	People x proportion	Total
UKI	335	-623 + 208	1	-415	16867
UKH	-304	(623/3)x2 = 415	304/(304+654) = 0.317	132	14801
UKJ	-654		654/(304+654) = 0.683	283	21354

Figure E.5: Number of individual by region before and after adjustment Option 3 HMRC 2002-03 data matched with the ASHE 2003 data.

#### Option 4

For this option the difference between number of people assigned to London on the ASHE and the HMRC ( $D_I$ ) is used again as the value for the adjustment (335 people in 2002-03); half of these people are left in London (UKI) and the other half are moved to the South East (UKJ).

$$IncrI = -\left(\frac{1}{2}\right)D_I$$

$$IncrJ = \left(\frac{1}{2}\right)D_I$$

Figure E.6: Number of individual by region, before and after adjustment Option 4  
 HMRC 2002-03 data matched with the ASHE 2003 data.

Option 5

The difference between the number of people assigned to London (UKI) on the HMRC and the number of people assigned to London on the ASHE is taken from London and added to the South East (UKJ). For example, for the HMRC 2002-03 ASHE 2003 data, 335 people are moved from London to the South East.

$$IncrI = -D_I \quad IncrJ = D_I$$

Figure E.7: Number of individuals by region before and after adjustment Option 5  
 HMRC 2002-03 data matched with the ASHE 2003 data

### Option 6

The differences in UKI and UKJ ( $D_I$  and  $D_J$ ) are added together (e.g.  $335 + (-654) = -319$  for the HMRC 2002-03 and ASHE 2003 data). This value is added to UKI and taken off UKJ (as the value is negative).

$$IncrI = D_J + D_I$$

$$IncrJ = -(D_J + D_I)$$

Figure E.8: Number of individual by region before and after adjustment Option 6 HMRC 2002-03 data matched with the ASHE 2003 data.

### Option 7

The difference between UKI on the ASHE and UKI on the HMRC is again used with 90 per cent of this difference added to UKJ and the other 10 per cent staying in UKI. This 90:10 per cent split is a suggested increment this could be changed to a 95:5 per cent split if this was deemed better:

$$IncrI = -(0.9 \times D_I)$$

$$IncrJ = (0.9 \times D_I)$$

Figure E.9: Number of individuals by region before and after adjustment Option 7  
 HMRC 2002-03 data matched with the ASHE 2003 data.

### Option 8 – Recommend Option

The mid point of the two differences is used to assign people between London (UKI) and the South East (UKJ):

$$IncrI = \frac{D_J - D_I}{2}$$

$$IncrJ = -\left(\frac{D_J - D_I}{2}\right)$$

This means the new value for  $D_I$  and  $D_J$  are the same as each other.

The HMRC 2002-03 matched with ASHE 2003 gives:

$$IncrI = \frac{-654 - 335}{2} = -494.5$$

So 494.5 people should be taken from UKI and added to UKJ, the new values for  $D_I$  and  $D_J$  are;  $D_I = 335 - 494.5 = -159.5$  and  $D_J = -654 + 494.5 = -159.5$ . This works consistently for any values of UKI or UKJ unlike some of the previous options. For the HMRC 2001-02 matched with the ASHE 2002;

$$IncrI = \frac{-620 + 8}{2} = -306$$

This adjustment minimises the sum of squares of the differences ( $D_I^2 + D_J^2$ ) for these two regions therefore making the overall sum of squares of differences as small as it can be by adjusting only UKI and UKJ. Therefore, this option should consistently

give an improved distribution independent of what the actual differences are in any particular year.

Figure E.10: Number of individual by region before and after adjustment Option 8 HMRC 2002-03 data matched with the ASHE 2003 data.

Summary of chi square results for all adjustment options

(see appendix F for Stuart-Maxwell test).

	2002-03	2001-02	2000-01
<b>No adjustment</b>	<b>26.96</b>	<b>21.96</b>	<b>25.69</b>
Option 1	18.62	22.10	23.60
Option 2	16.08	22.17	22.68
Option 3	14.94	21.70	21.01
Option 4	20.02	22.08	23.98
Option 5	16.04	22.21	22.52
Option 6	16.29	24.92	21.75
Option 7	16.60	22.18	22.79
<b>Option 8</b>	<b>15.03</b>	<b>17.97</b>	<b>19.18</b>

**Chi square (11)**      95 per cent = 19.675  
                                  99 per cent = 24.725

Conclusion

In all options, except 3 and 8, the 2001-02 chi square value is higher for the adjusted data than the unadjusted data. The majority of these adjustments are based on the 2002-03 data and then extended to the other years; therefore, they do not take into account the variations in the data from year to year.

Of the two viable options, the 2002-03 chi square value is lower for Option 3. However, this is only best in 2002-03 and, therefore, the best option over all years is

Option 8. Option 8 is the only option where the distributions are not statistically significantly different in all years at the 95 per cent significance level (i.e. the chi square value calculated from the data is always below 19.68). The way Option 8 works means it will always be the best option out of Options 4 to 8. Option 3 could be better in some years (i.e. 2002-03) but the 2001-02 data shows that in other years the chi-squared value is higher for Option 3 than Option 8. Therefore, to enable a consistent approach to be used in future Option 8 is recommended by ONS Regional Accounts.

### **Combining Earnings and People**

This section shows the three earnings options considered as specified in section 4. The effect of the earnings adjustments are shown on Option 3 and Option 8.

#### Option A – Recommended Option

All people moved are assigned the mean pay of the donor region (in this case it would always be London (UKI)). The number of people moved multiplied by the mean annual pay for the region would be taken off the donor region and added to the region these people are assigned to. This is a sensible choice as it means individuals are assumed to have the mean pay they have contributed towards.

#### Option B

The people who are moved would be assigned the mean pay of the region they are moving into. For example, all the people who are moved to the South East would be assigned the mean pay of all records in the South East. This value would be added to the South East and taken off the London (donor region) total earnings. This means people who are being moved are given the earnings of the region it is believed they should have been in originally.

#### Option C

The people who are moving from London to the South East could be given the mean pay of those people who are assigned to London on the HMRC and the South East on the ASHE. These are the people effectively being moved. The same could be the case for those people who are moved from London to the East of England.

This option could create more error as the sample sizes for these groups are smaller and therefore subject to more erratic mean earnings. Also, it is not possible to use this mean for the unmatched individuals - who we know have different characteristics to the matched individuals. Therefore Option A is the best option.

### **Earnings applied to Option 3**

Option 3 is not the preferred option for moving people however it was considered to make sure that the option recommended is still the best option when the assignment of money has been considered. All results below refer to the matched data only.

The table below shows the difference, as a percentage of UK total pay, between the HMRC original data and the HMRC with the “correct” address according to the ASHE.

	UKH	UKI	UKJ
<b>2002-03</b>	-0.3%	0.3%	-1.0%
<b>2001-02</b>	-0.1%	-0.1%	-1.0%
<b>2000-01</b>	-0.3%	0.0%	-1.0%

The sum of squares differences for 2002-03 and 2001-02 is 2.1 per cent (it is multiplied by 100 to make it consistent with the units used in the table; all sum of square differences shown below are in equivalent units). This can be compared with the equivalent number once an adjustment has taken place. A lower value indicates the adjusted HMRC is an improvement.

### Option A

Figure E.11: Change in earnings by region due to adjustment Option 3 combined with adjustment Option A 2002-03.

This table shows the change in percentage of total pay by region for the HMRC before and after the adjustment. These show the change in HMRC earnings by region. For example, for the 2002-03 data 0.4 per cent less of UK earnings are assigned to London (UKI) on the adjusted data than they were on the original data. This 0.4 per cent is split between the East of England and the South East.

	UKH	UKI	UKJ
<b>2002-03</b>	0.1%	-0.4%	0.3%
<b>2001-02</b>	0.1%	-0.5%	0.4%
<b>2000-01</b>	0.2%	-0.6%	0.4%

Difference between adjusted HMRC and HMRC with “correct” addresses:

	UKH	UKI	UKJ
<b>2002-03</b>	-0.2%	0.0%	-0.7%
<b>2001-02</b>	0.0%	-0.6%	-0.6%
<b>2000-01</b>	-0.1%	-0.6%	-0.6%

Sum of squares of differences for 2002-03 and 2001-02 is 1.3 per cent. This is lower than the sum of squares of differences prior to any adjustment.

### Option B

Figure E.12: Change in earnings by region due to adjustment Option 3 combined with adjustment Option B 2002-03

Change in percentage of total pay by region for the HMRC before and after the adjustment:

	UKH	UKI	UKJ
<b>2002-03</b>	0.1%	-0.3%	0.2%
<b>2001-02</b>	0.1%	-0.4%	0.3%
<b>2000-01</b>	0.2%	-0.5%	0.3%

Difference in adjusted HMRC and HMRC if all addresses are correct – according to the ASHE:

	UKH	UKI	UKJ
<b>2002-03</b>	-0.2%	0.0%	-0.8%
<b>2001-02</b>	-0.0%	-0.4%	-0.7%
<b>2000-01</b>	-0.1%	-0.4%	-0.7%

Sum of squares of differences for 2002-03 and 2001-02 is 1.3 per cent.

### Option C

Figure E.13: Change in earnings by region due to adjustment Option 3 combined with adjustment Option C 2002-03

Change in percentage of total pay by region for the HMRC before and after the adjustment:

	UKH	UKI	UKJ
<b>2002-03</b>	0.1%	-0.5%	0.3%
<b>2001-02</b>	0.1%	-0.7%	0.5%
<b>2000-01</b>	0.3%	-0.8%	0.6%

Difference in adjusted HMRC and HMRC if all addresses are correct:

	UKH	UKI	UKJ
<b>2002-03</b>	-0.2%	-0.2%	-0.6%
<b>2001-02</b>	0.0%	-0.8%	-0.4%
<b>2000-01</b>	0.0%	-0.8%	-0.5%

Sum of squares of differences for 2002-03 and 2001-02 is 1.2 per cent

### **Earnings applied to Option 8**

Option 8 is the recommended option for the movement of people. The effects of the three possible options for the assignment of money when applied to this choice for the movement of people are shown below.

#### Option A

**Figure E.14: Change in earnings by region due to adjustment Option 8 combined with adjustment Option A 2002-03**

This table shows the change in percentage of total pay by region for the HMRC before and after the adjustment:

	UKH	UKI	UKJ
<b>2002-03</b>	0.0%	-0.4%	0.4%
<b>2001-02</b>	0.0%	-0.3%	0.3%
<b>2000-01</b>	0.0%	-0.4%	0.4%

Difference in adjusted HMRC and HMRC if all addresses are correct:

	UKH	UKI	UKJ
<b>2002-03</b>	-0.3%	-0.1%	-0.5%
<b>2001-02</b>	-0.1%	-0.4%	-0.7%
<b>2000-01</b>	-0.3%	-0.3%	-0.7%

The sum of squares of differences for 2002-03 and 2001-02 is: 0.9 per cent (even though UKH is not included in the adjustment it is shown here and in the options below so the sum of squares values are comparable with the values for Option 3. This value of 0.9 per cent is lower than any of the corresponding values for Option 3.

### Option B

Figure E.15: Change in earnings by region due to adjustment Option 8 combined with adjustment Option B 2002-03

This table shows the change in percentage of total pay by region for the HMRC before and after the adjustment:

	UKH	UKI	UKJ
<b>2002-03</b>	0.0%	-0.3	0.3%
<b>2001-02</b>	0.0%	-0.2%	0.2%
<b>2000-01</b>	0.0%	-0.3%	0.3%

Difference in adjusted HMRC and HMRC if all addresses are correct:

	UKH	UKI	UKJ
<b>2002-03</b>	-0.3%	0.0%	-0.6%
<b>2001-02</b>	-0.1%	-0.3%	-0.7%
<b>2000-01</b>	-0.3%	-0.3%	-0.8%

Sum of squares differences for 2002-03 and 2001-02 = 1.0 per cent

### Option C

Figure E.16: Change in earnings by region due to adjustment Option 8 combined with adjustment Option C 2002-03

This table shows the change in percentage of total pay by region for the HMRC before and after the adjustment:

	UKH	UKI	UKJ
<b>2002-03</b>	0.0%	-0.6%	0.6%
<b>2001-02</b>	0.0%	-0.4%	0.4%
<b>2000-01</b>	0.0%	-0.6%	0.6%

Difference in adjusted HMRC and HMRC if all addresses are correct:

	UKH	UKI	UKJ
<b>2002-03</b>	-0.3%	-0.3%	-0.4%
<b>2001-02</b>	-0.1%	-0.5%	-0.6%
<b>2000-01</b>	-0.3%	-0.5%	-0.5%

Sum of squares of differences for 2002-03 and 2001-02 is 0.9 per cent.

## Conclusion

From the analysis shown above Option 8 is still the best option for the movement of people. Figure E.17 below summarises the results of the options for the movement of money when applied to Option 8. It shows the change in percentage of UK pay for UKI (London) and UKJ (South East).

Figure E.17: Value of percentage of UK total pay by region for the adjusted HMRC minus the HMRC with ASHE address.

Option	UKI			UKJ			Sum of Squares*
	2002-03	2001-02	2000-01	2002-03	2001-02	2000-01	
Prior to adjustment	0.3%	-0.1%	0.0%	-1.0%	-1.0%	-1.0%	2.1%
A. Donor region mean pay (UKI).	-0.1%	-0.4%	-0.3%	-0.5%	-0.7%	-0.7%	0.9%
B. Receiving region (UKJ) mean pay.	0.0%	-0.3%	-0.3%	-0.6%	-0.7%	-0.8%	1.0%
C. Mean pay for records assigned to donor region on the HMRC (UKI) and receiving region on ASHE (UKJ).	-0.3%	-0.5%	-0.5%	-0.4%	-0.6%	-0.5%	0.9%

\*Sum of squares for 2002-03 and 2001-02.

The difference in results caused by mean pay is very small; Options B and C give very similar values for the sum of squares. However, as mentioned above Option C has some downfalls. For example, there is no equivalent mean pay on the unmatched dataset that can be used when the adjustment is extended to the unmatched data. Therefore, the preferred mean pay to assign the records that are moving is that of the donor region (UKI).

### Adjustment for the unmatched data

The report shows two ways of extending the adjustment for the matched data to the unmatched data (see section 4.1.1);

- a) The proportion of total money as found from the matched dataset should be applied to the whole dataset, or,
- b) The percentage of people moved from London on the matched dataset are also taken off London on the unmatched dataset, with each record being assigned the corresponding London mean pay (matched or unmatched respectively).

The report specifies that the second of these options is better because it takes into account the different characteristics exhibited by the unmatched data. The equation below shows how the adjustment should be carried out on the whole dataset given the stages specified in this appendix.

Say  $D = \text{midpoint of } D_1 \text{ and } D_2$  (the number of people being moved from London to the South East). Let the mean pay for London on the matched and unmatched datasets be  $P$  and  $P'$  respectively. Let the population of London on the matched and unmatched datasets be  $L$  and  $L'$  respectively. Therefore, the adjustment to the matched data can be written as:

$$D \times P$$

(i.e. the number of people to be moved from the matched dataset multiplied by the mean pay in London for the matched records).

The unmatched data adjustment can be written as:

$$\left( \frac{D}{L} \times L' \times P' \right)$$

(i.e. the proportion of the matched London population being moved multiplied by the number of individuals in London on the unmatched dataset multiplied by the mean pay for London on the unmatched dataset).

This means the adjustment to the whole dataset is:

$$\begin{aligned} & (D \times P) + \left( \frac{D}{L} \times L' \times P' \right) \\ &= \frac{(D \times P \times L) + (D \times L' \times P')}{L} \\ &= \frac{D}{L} \times (LP + L'P') \end{aligned}$$

This final equation shows that once the proportion of individuals from London being moved to the South East is known ( $D/L$ ) the value of the adjustment can be calculated from the total pay assigned to London ( $LP + L'P'$ ). Figure E.18 shows the effect of this adjustment on the HMRC PAYE aggregated data as supplied by HMRC.

Figure E.18: Aggregated HMRC 2002-03 data as provided to ONS Regional Accounts and post adjustment (£million).

## **Appendix F Stuart-Maxwell Test**

Following concerns about the validity of the chi square test in this situation ONS Methodology Directorate consulted with the University of Southampton and ONS Regional Accounts was recommended to carry out a Stuart-Maxwell<sup>4</sup> extension to McNemar's test. The test was carried out to compare all options considered for the NUTS1 movement of people (Section 4.1.1).

The test values for the 8 options considered, and no adjustment, are shown in the table below:

	2000-01	2001-02	2002-03
No adjustment	395	363	364
Option 1	380	364	305
Option 2	374	365	287
Option 3	349.7	347.2	279.3
Option 4	383	364	315
Option 5	373	365	289
Option 6	362	364	291
Option 7	375	365	293
Option 8	349.8	330.6	281.9

The chi square distribution is used to test the significance of the result. However, all these values are above the chi square value from the table. The smallest number in the table shows the distribution that is closest to what it is judged it should be. This is clearer in a table of rankings with the lowest test value for a year ranked 1 and the highest test value ranked 9:

	2000-01	2001-02	2002-03
No adjustment	9	3	9
Option 1	7	6	7
Option 2	5	7	3
Option 3	1	2	1
Option 4	8	5	8
Option 5	4	9	4
Option 6	3	4	5
Option 7	6	8	6
Option 8	2	1	2

This test works by comparing where an individual appears in a K-1 x K-1 table (in this case K = 12 as there are 12 NUTS1 regions, so the table is 11 by 11). In order to adjust the data individuals are moved from one cell to another. The effect this adjustment has on the results is seen in the values above. The table below gives an example of how the adjustment works showing only the three regions to be adjusted. The results shown above were found leaving individuals in London on the ASHE (column UKI) and changing their region on the HMRC. For example, if 250 people were moved from UKI to UKJ in the adjustment they stayed in column UKI and were

---

<sup>4</sup> A test of Marginal Homogeneity (Stuart, 1955; Maxwell, 1970; Everitt, 1977).

moved from the cell with 15,000 people<sup>5</sup> in (UKI on the HMRC) to the cell below it with 500 people in it (UKJ on the HMRC).

		ASHE		
		UKH	UKI	UKJ
HMRC	UKH	12500	250	250
	UKI	500	15000	750
	UKJ	250	500	20000

		ASHE		
		UKH	UKI	UKJ
HMRC	UKH	12500	250	250
	UKI	500	14750	750
	UKJ	250	750	20000

This was the preferred way of carrying out the adjustment by ONS Methodology Directorate and so is used in the results in this paper. However, people could instead have been moved from those who are in UKJ on the ASHE and UKI on the HMRC into UKJ on both datasets (in some ways this makes more sense as these are the people the adjustment is moving) with very similar results.

Both methods of adjustment show that Option 3 and Option 8 vary between giving the lowest test value. Therefore, based on this test combined with other information Regional Accounts propose Option 8 for the adjustment to the HMRC PAYE dataset at the NUTS1 level.

## Appendix G Pay by region NUTS2 and 3

### NUTS2

Figure G.1: Percentage of HMRC total pay assigned to each region, comparing the HMRC 2002-03 matched data as it is and as it should be if all address are correct according to the ASHE.

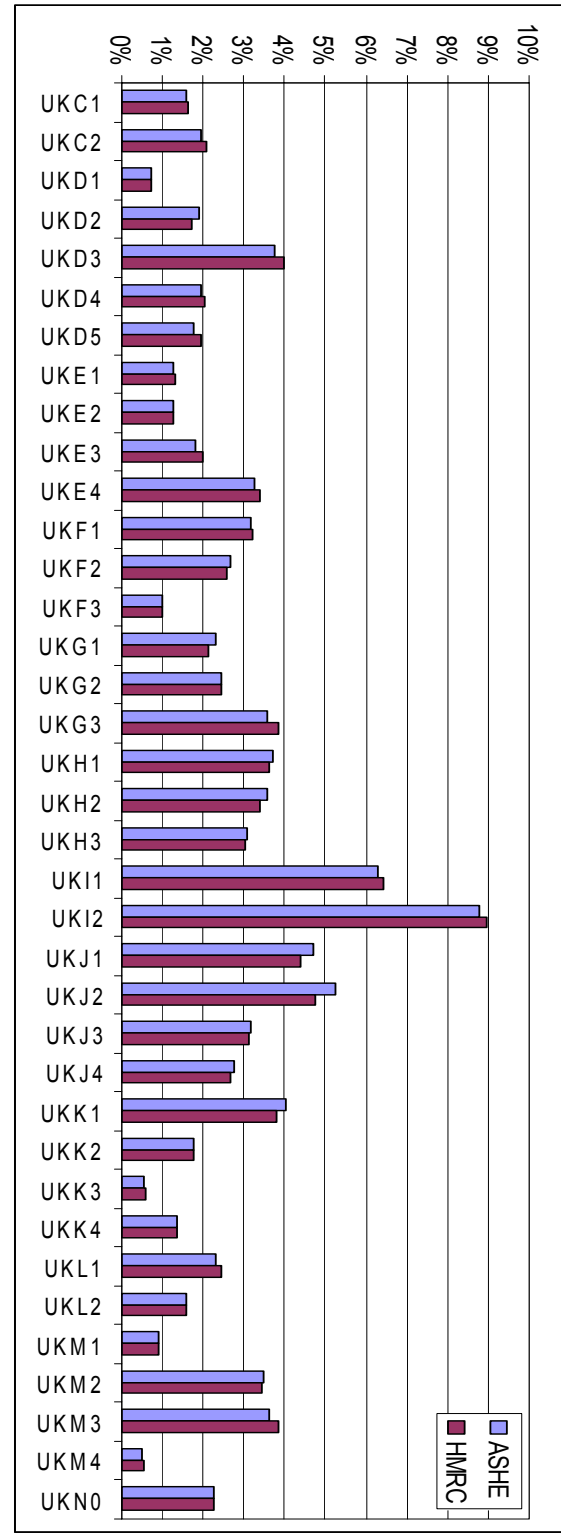

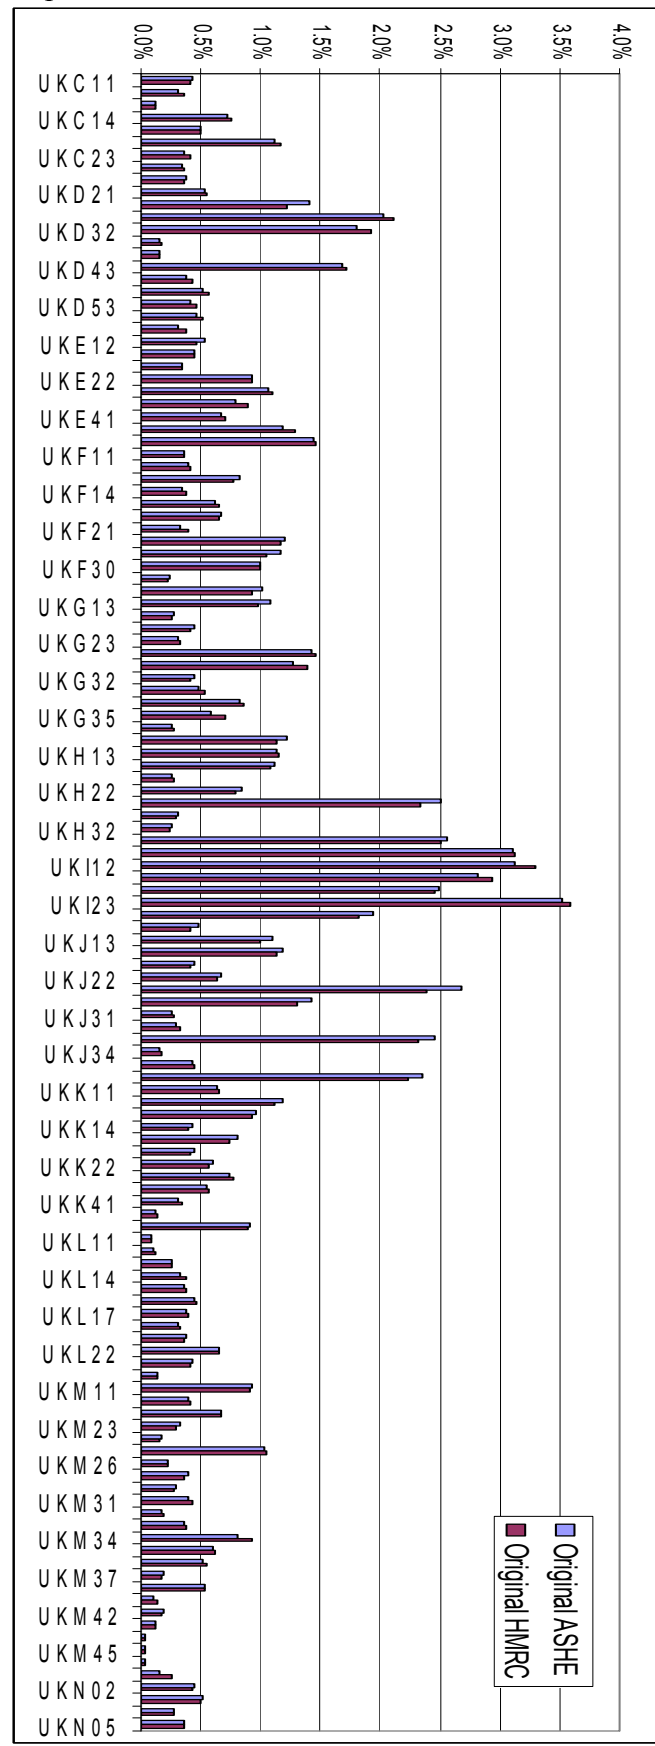

Figure G.2: Percentage of total pay by NUTS3 region for the HMRC 2002-03 with HMRC address compared with ASHE address information.

## **Appendix H Adjustment at NUTS2 and NUTS3 levels**

Section 4.2 of the report outlines the possible NUTS 2 and 3 adjustments. The chi-squared tests shown below indicate that the NUTS1 adjustment can be extended to NUTS2 (37 regions) and NUTS3 (133 regions) levels with only those regions adjusted at NUTS1 being adjusted.

### NUTS2

A chi square test was carried out on the number of individuals assigned to each region on the HMRC 2002-03 compared with the ASHE 2003 at the NUTS2 level. This showed that the two distributions are statistically significantly different. However, if all the regions that make up UKJ (South East) are removed (UKJ1 – Berkshire Buckinghamshire and Oxfordshire, UKJ2 – Surrey, East and West Sussex, UKJ3 – Hampshire and the Isle of Wight and UKJ4 - Kent) then the difference is no longer significant (i.e. the chi square value from the table is higher than the chi square value calculated from the data).

#### Chi square test results:

Chi-squared (36 d.f.)	=	52.45
Stats Table Chi-squared (36 d.f.) - 95 per cent level	=	52.19
<b>Statistically Significantly Different.</b>		

Chi-squared excluding UKJ - South East (32 d.f.)	=	37.57
Stats Table Chi-squared (32 d.f.) - 95 per cent level	=	46.19
<b>Not Statistically Significantly Different.</b>		

### NUTS3

At the NUTS3 level the chi square test shows the distributions to be not statistically significantly different with all regions included:

Chi-squared (133 d.f.)	=	114.61
Stats Table Chi-squared (100 d.f.) - 95 per cent level	=	124.34
<b>Not Statistically Significantly Different.</b>		

Therefore, the only adjustment needed is to allocate the movement of money from the adjustment at the higher levels. In section 4.2 two ways of allocating these earnings are considered.

The first option uses the same basis for adjustment as the NUTS1 adjustment. The difference between the number of people assigned to a region on the ASHE and the number of people assigned to the same region on the HMRC is used as the basis for the allocation. The share of earnings moved at the NUTS1 level is split up in proportion to the size of these differences in the NUTS2 and 3 regions with in the NUTS1 region. For example, the region in the South East that has the biggest difference between the number of people on the ASHE and the HMRC will get the largest proportion of the money assigned to the South East at the NUTS1 level.

This method causes variability in the results, and in some cases this adjustment would take money from a region in the South East when the NUTS1 adjustment allocates money to the South East. However, this can be avoided by removing all regions where the difference at the NUTS2 or 3 levels are not consistent with the difference at the NUTS1 level.

If the money to be taken from UKI and added to UKJ from the NUTS1 adjustment is  $m$  the money to be added to each region at the NUTS2 level is (examples use 2002-03 values):

$$IncrI1 = -m \times \left( \frac{D_{I1}}{D_{I1} + D_{I2}} \right) = -m \times \left( \frac{193}{193 + 151} \right) = -0.56m$$

$$IncrI2 = -m \times \left( \frac{D_{I2}}{D_{I1} + D_{I2}} \right) = -m \times \left( \frac{151}{193 + 151} \right) = -0.44m$$

$$IncrJ1 = m \times \left( \frac{D_{J1}}{D_{J1} + D_{J2} + D_{J3} + D_{J4}} \right) = m \times \left( \frac{-208}{-208 - 379 - 30 - 40} \right) = 0.32m$$

With the increments for UKJ2, UKJ3 and UKJ4 worked out in the same way as UKJ1. Wherever  $D_{I1}$  or  $D_{I2}$  are negative none of the NUTS1 adjustment comes off that region. Wherever  $D_{J1}$ ,  $D_{J2}$ ,  $D_{J3}$  or  $D_{J4}$  are positive none of the money allocated to the South East at the NUTS1 level is assigned to that region.

An alternative adjustment is to use the number of people in employment in each region to apportion out the money at NUTS2 and 3 levels. This is better than the previous option in terms of consistency over time. However, it implies that migration from London to the South East affects all regions equally. In practice it would be expected (and it can be seen in the differences) that more people migrate to regions closer to London (often within commuting distance of London), which this method would not allow for. The Figures below compare the size of adjustment for each region using the two options specified above.

Figure H.1: Proportion of UK total pay added to each region as a result of the adjustment Options at NUTS2 for the 2002-03 HMRC data.

Figure H.2: Proportion of UK total pay added to each region as a result of the adjustment Options at NUTS2 for the 2001-02 HMRC data.

Figure H.3: Proportion of UK total pay added to each region as a result of the adjustment Options at NUTS3 for the 2002-03 HMRC data.

Figure H.4: Proportion of UK total pay added to each region as a result of the adjustment Options at NUTS3 for the 2001-02 HMRC data.

These figures show there is quite a lot of variation between the 2002-03 HMRC data and the 2001-02 data, if the method using the differences between the HMRC and ASHE data is used. However, there are also limitations of using the employment figures as these may not give an accurate picture of where the migration is occurring.

## **Appendix I NUTS Regions**

### **NUTS1 Regions**

UKC	North East
UKD	North West
UKE	Yorkshire and The Humber
UKF	East Midlands
UKG	West Midlands
UKH	East of England
UKI	London
UKJ	South East
UKK	South West
UKL	Wales
UKM	Scotland
UKN	Northern Ireland

### **NUTS2 Regions**

UKC1	Tees Valley and Durham
UKC2	Northumberland and Tyne and Wear
UKD1	Cumbria
UKD2	Cheshire
UKD3	Greater Manchester
UKD4	Lancashire
UKD5	Merseyside
UKE1	East Riding and North Lincolnshire
UKE2	North Yorkshire
UKE3	South Yorkshire
UKE4	West Yorkshire
UKF1	Derbyshire and Nottinghamshire
UKF2	Leicestershire, Rutland and Northamptonshire
UKF3	Lincolnshire
UKG1	Herefordshire, Worcestershire and Warwickshire
UKG2	Shropshire and Staffordshire
UKG3	West Midlands
UKH1	East Anglia
UKH2	Bedfordshire and Hertfordshire
UKH3	Essex
UKI1	Inner London
UKI2	Outer London
UKJ1	Berkshire, Buckinghamshire and Oxfordshire
UKJ2	Surrey, East and West Sussex
UKJ3	Hampshire and Isle of Wight
UKJ4	Kent
UKK1	Gloucester, Wiltshire and North Somerset
UKK2	Dorset and Somerset
UKK3	Cornwall and Isles of Scilly
UKK4	Devon
UKL1	West Wales and The Valleys
UKL2	East Wales
UKM1	North Eastern Scotland
UKM2	Eastern Scotland
UKM3	South Western Scotland
UKM4	Highlands and Islands
UKN0	Northern Ireland

### NUTS3 Regions

## **Appendix J Standard Industrial Classification (SIC) Codes**

### **31 Industries**

AO1 - Agriculture  
AO2 - Forestry  
B - Fishing  
CA - Oil and gas extraction  
CB - Other mining and quarrying  
DA - Manufacture of foods, beverages and tobacco  
DB - Manufacture of textiles and textile products  
DC - Manufacture of leather and leather products  
DD - Manufacture of wood and wood products  
DE - Manufacture of paper and paper products  
DF - Manufacture of coke products, refined petroleum products and nuclear fuel  
DG - Manufacture of chemicals and chemical products  
DH - Manufacture of rubber and plastic products  
DI - Manufacture of other and plastic mineral products  
DJ - Manufacture of basic metals and fabricated metal products  
DK - Manufacture of machinery and equipment not elsewhere classified  
DL - Manufacture of electrical and optical equipment  
DM - Manufacture of transport equipment  
DN - Manufacturing not elsewhere classified  
E - Electricity, gas and water supply  
F - Construction  
G - Wholesale and retail trade, repair of motor vehicles and household goods  
H - Hotels and restaurants  
I - Transport, storage and communication  
J - Financial intermediation  
K - Real estate, renting and business activities  
L - Public administration and defence  
M - Education  
N - Health and social work  
O - Other activities  
P - Persons employed by private households

## **Appendix K Abbreviations**

<b>ASHE</b>	- Annual Survey of Hours and Earnings
<b>CoE</b>	- Compensation of Employees
<b>GDHI</b>	- Gross Disposable Household Income
<b>GVA</b>	- gross value added
<b>HMRC</b>	- Her Majesty's Revenue and Customs
<b>IR</b>	- Inland Revenue
<b>LFS</b>	- Labour Force Survey
<b>NES</b>	- New Earnings Survey (replaced by ASHE)
<b>NINO</b>	- National Insurance Number
<b>NIRS</b>	- National Insurance Recording System
<b>NUTS</b>	- Nomenclature of Units for Territorial Statistics
<b>ONS</b>	- Office for National Statistics
<b>PAYE</b>	- pay-as-you-earn
<b>SIC</b>	- Standard industrial classification
<b>STES</b>	- Short term employment survey

## INDEX OF TABLES

- NUTS1:1** Headline gross value added (GVA) at current basic prices by region 1991 to 2003.
- NUTS1:2** Headline gross value added (GVA) by component of income at current basic prices 1991 to 2003.
- NUTS1:3** Headline gross value added by industry groups, current basic prices by region 1991-2002.
- NUTS1:4** Headline workplace based gross value added (GVA) at current basic prices 1991 to 2003.
- NUTS1:5** Gross value added (GVA) at current basic prices by region 1991 to 2003.
- NUTS1:6** Gross value added (GVA) by component of income at current basic prices by region 1991 to 2003.
- NUTS1:7** Gross value added by industry groups, current basic prices by region 1991 to 2002.
- NUTS1:8** Workplace based gross value added (GVA) at current basic prices 1991 to 2003.
- RN1:1** Revisions - Headline gross value added (GVA) at current basic prices by region 1991 to 2002.
- RN1:2** Revisions - Headline gross value added (GVA) by component of income at current basic prices 1991 to 2002.
- RN1:3** Revisions - Headline gross value added by industry groups, current basic prices by region 1991 to 2001.
- RN1:4** Revisions - Headline workplace based gross value added (GVA) at current basic prices 1991 to 2002
- NUTS2:1** Headline gross value added (GVA) by NUTS2 area at current basic prices.
- NUTS2:2** Headline gross value added (GVA), per head by NUTS2 area at current basic prices.
- NUTS2:3** Headline gross value added (GVA) per head indices by NUTS2 area at current basic prices.
- NUTS2:4** Headline compensation of employees (COE) by NUTS2 area at current basic prices.
- NUTS2:5** Headline gross value added (GVA) by NUTS2 area and 17 industries at current basic prices.
- NUTS2:6** Headline compensation of employees (COE) by NUTS2 area and 17 industries at current basic prices.
- NUTS2:7** Gross value added (GVA) by NUTS2 area at current basic prices.
- NUTS2:8** Gross value added (GVA) per head by NUTS2 area at current basic prices.
- NUTS2:9** Gross value added (GVA) per head indices by NUTS2 area at current basic prices.
- NUTS2:10** Compensation of employees (COE) by NUTS2 area at current basic prices.
- NUTS2:11** Gross value added (GVA) by NUTS2 area and 17 industries at current basic prices.
- NUTS2:12** Compensation of employees (COE) by NUTS2 area and 17 industries at current basic prices.
- NUTS2:13** Gross value added (GVA) by NUTS2 area FISIM allocated to industries.
- RN2:1** Revisions - Headline gross value added (GVA) by NUTS2 area at current basic prices
- RN2:2** Revisions - Headline gross value added (GVA) per head by NUTS2 area at current basic prices.
- RN2:3** Revisions - Headline gross value added (GVA) per head indices by NUTS2 area at current basic prices.
- NUTS3:1** Headline 1 gross value added (GVA) by NUTS3 area at current basic prices 1995 to 2002.
- NUTS3:2** Headline gross value added (GVA) per head by NUTS3 area at current basic prices 1995 to 2002.
- NUTS3:3** Headline 1 gross value added (GVA) per head indices by NUTS3 area at current basic prices 1995 to 2002.
- NUTS3:4** Headline 1 gross value added (GVA) by NUTS3 area and 3 industries at current basic prices 1995 to 2002.
- NUTS3:5** Unadjusted (constrained to headline NUTS2) gross value added (GVA) by NUTS3 area at current basic prices 1995 to 2002.
- NUTS3:6** Unadjusted (constrained to headline NUTS2) gross value added (GVA) per head by NUTS3 area at current basic prices 1995 to 2002.
- NUTS3:7** Unadjusted (constrained to headline NUTS2) gross value added (GVA) per head indices by NUTS3 area at current basic prices.
- NUTS3:8** Unadjusted (constrained to Headline NUTS2) gross value added (GVA) by NUTS 3 area and 3 industries at current basic prices.
- NUTS3:9** Unadjusted (constrained to unadjusted NUTS2) gross value added (GVA) by NUTS3 area at current basic prices 1995 to 2002.
- NUTS3:10** Unadjusted (constrained to unadjusted NUTS2) gross value added (GVA) per head by NUTS3 area at current basic prices.
- NUTS3:11** Unadjusted (constrained to unadjusted NUTS2) gross value added (GVA) per head indices by NUTS3 area at current basic prices.
- NUTS3:12** Unadjusted (constrained to unadjusted NUTS2) gross value added (GVA) by NUTS 3 area and 3 industries at current basic prices.
- RN3:1** Revisions - Headline gross value added (GVA) by NUTS3 area at current basic prices 1995 to 2001.
- RN3:2** Revisions - Headline gross value added (GVA) per head by NUTS3 area at current basic prices 1995 to 2001.
- RN3:3** Revisions - Headline gross value added (GVA) per head indices by NUTS3 area at current basic prices 1995-2001.

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.

3 Components may not sum to totals as a result of rounding.

4 Provisional

5 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.  
2 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.  
3 Components may not sum due to rounding.  
4 Public administration, national defence and compulsory social security.  
5 Financial Intermediation Services Indirectly Measured.

# NUTS1:3

## Headline<sup>1</sup> Gross Value Added<sup>2,3</sup> by industry groups, current basic prices by region 1992 to 2003

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 Provisional

5 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 Estimates of regional GVA in this table are on a residence basis, where income of commuters is allocated to where they live rather than their place of work.

2 Components may not sum to totals as a result of rounding.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

4 Provisional

# NUTS1:6 Gross Value Added<sup>1,2</sup> (GVA) by component of income at current basic prices by region 1992 to 2004

1 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.

2 Components may not sum to totals as a result of rounding.

3 Provisional

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

5 Including taxes on production

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.

3 Components may not sum due to rounding.

4 Public administration, national defence and compulsory social security.

5 Financial Intermediation Services Indirectly Measured.

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based on GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra -Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline COE series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based COE allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The COE for Extra-Regio comprises compensation of employees which cannot be assigned to regions.

1 The headline COE series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based COE allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 Including Extra-Regio.

5 Other community, social and personal service activities and private households with employed persons.

1 Estimates of workplace based GVA allocate income to the region in which commuters work.

2 Components may not sum to totals as a result of rounding.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based on GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

# NUTS3:2

Headline <sup>1</sup> gross value added (GVA)<sup>2</sup> per head by NUTS3 area at current basic prices 1995 to 2003

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals due to rounding.

4 Including Extra-Regio.

5 Including Financial Intermediation Services Indirectly Measured (FISIM).

1 Estimates of workplace based GVA allocate to the region in which commuters work.

2 Components may not sum to totals as a result of rounding.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 Estimates of workplace based GVA allocate income to the region in which commuters work.

2 Components may not sum to totals as a result of rounding.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 Estimates of workplace based GVA allocate income to the region in which commuters work.

2 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.
